#### **Auto Switch Variations**

#### **Auto Switch Variations 1**

\* These auto switches can be mounted with a band, a rail, a tie-rod or a square groove when auto switch mounting brackets are used. Refer to pages 1386, 1390, 1394 and 1401 to 1403 for details.

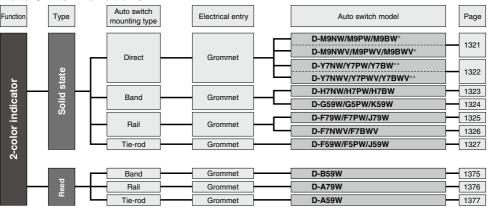

\*\* These auto switches can be mounted with a tie-rod when auto switch mounting brackets are used. Refer to page 1397 for details.

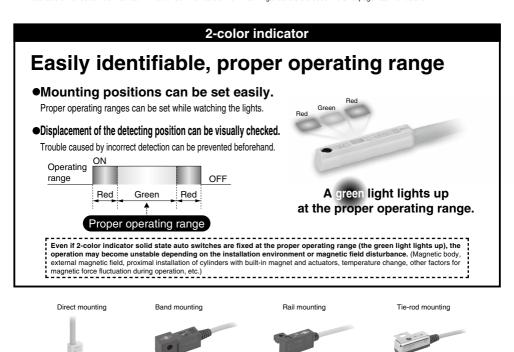

#### **Auto Switch Variations**

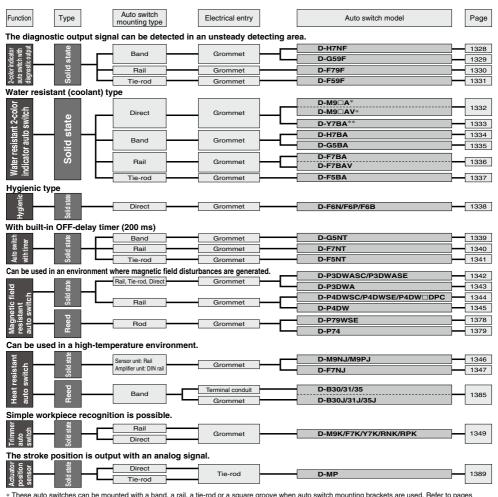

#### **Auto Switch Variations 2**

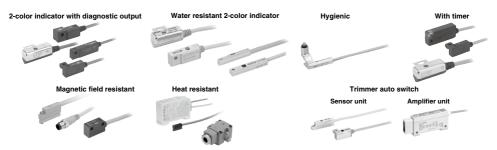

- \* These auto switches can be mounted with a band, a rail, a tie-rod or a square groove when auto switch mounting brackets are used. Refer to pages 1386, 1390, 1394 and 1401 to 1403 for details.
- \*\* These auto switches can be mounted with a tie-rod when auto switch mounting brackets are used. Refer to page 1397 for details.

# BEST AUTOMATION Auto Switch Variations

- These auto switches can be mounted with a band, a rail, a tie-rod or a square groove when auto switch mounting brackets are used. Refer to pages 1386, 1390, 1394 and 1401 to 1403 for details.
- \*\* These auto switches can be mounted with a tie-rod when auto switch mounting brackets are used. Refer to page 1397 for details.

# **Prior to Use**Auto Switches Common Specifications 1

Refer to the Auto Switch Precautions on pages 14 to 18 before using auto switches.

#### **Auto Switches Common Specifications**

Туре	Reed auto switch	Solid state auto switch
Leakage current	None	3-wire: 100 µA or less, 2-wire: 0.8 mA or less
Operating time	1.2 ms	1 ms or less *3
Impact resistance	300 m/s <sup>2</sup>	1000 m/s <sup>2</sup> *4
Insulation resistance	50 $\mbox{M}\Omega$ or more (500 VDC measured via m	egohmmeter) (Between lead wire and case)
Withstand voltage	1500 VAC for 1 minute *1 (Between lead wire and case)	1000 VAC for 1 minute (Between lead wire and case)
Ambient temperature	-10 to	o 60°C
Enclosure	IEC60529 Sta	andard IP67 *2

- \*1 Electrical entry: Connector type (A73C/A80C/C73C/C80C): 1000 VAC/min. (Between lead wire and case)
- \*2 The terminal conduit type (D-A3/A3□A/A3□C/G39/G39A/G39C/K39/K39A/K39C), DIN terminal type (D-A44/A4A/A44C), and heat-resistant auto switch (D-F7NJ) are IEC60529 Standard IP63 compliant.

The trimmer type amplifier section (D-R K) is compliant with IP40.

The enclosure IP rating does not include the switch lead wire end.

For switches with a connector, the enclosure IP requirements are satisfied when the connector is connected.

- \*3 Excludes solid state auto switches with a timer (G5NT/F7NT/F5NT types) and the magnetic field resistant 2-color indicator solid state auto switch (D-P3DW□/P4DW). The operating time for the D-P3DW□/P4DW is 40 ms or less.
- \*4 980 m/s2 for the trimmer type sensor section, 98 m/s2 for the amplifier section

#### Lead Wire

- ●: Standard ○: Produced upon receipt of order (Standard)
- \*1 Applicable to the connector type (D-DDC) only
- \*2 Applicable to the D-M9□(V), D-M9□W(V), D-M9□A(V), and D-A93 only
- \*3 Applicable to the D-B53/B54, D-C73(C)/C80C, D-A93(V), D-A73(C)/A80C, D-A53/A54, D-Z73, and D-90/97/90A/93A only
- \*4 For reed auto switches M8 and M12 type with connector, please contact SMC.
- \*5 The standard lead wire length of the trimmer auto switch is 3 m.
- \*6 The standard lead wire length of the solid state auto switch with a timer (with the exception of the D-P3DWA and D-M9□A(V)□), water-resistant 2-color indicator solid state auto switch, heat-resistant 2-color indicator solid state auto switch, and strong magnetic field resistant 2-color indicator solid state auto switch is 3 m or 5 m. (Product with a lead wire length of 0.5 m is not available.)
- \*7 Applicable to the D-P5DW only

#### Lead wires with a connector indication

Part No. of Lead Wires with Connectors

(Applicable only	for connector type)
Model	Lead wire length
D-LC05	0.5 m
D-LC30	3 m
D-LC50	5 m

# **Prior to Use**Auto Switches Common Specifications 2

Refer to the Auto Switch Precautions on pages 14 to 18 before using auto switches.

Term	Meaning
Hysteresis	A deviation amount between the ON position and OFF position caused by auto switch characteristics (difference in sensitivity between ON and OFF). When the switch is turned ON once and the switch (or piston) is moved in the opposition in the opposition and office the opposition of t
Most sensitive position	Please contact SMC if hysteresis causes an operational problem.  A position (sensor layout position) where the sensitivity on the detection surface of the auto switch enclosure is highest.  When the center of the magnet is aligned with this position, it is basically at the center of the operating range and stable operation can be obtained.
Programmable Logic Controller (PLC)	One of the elements that makes up the sequence control.  The PLC is designed so that it can receive signals, such as the auto switch output signal, and output them to other devices in order to perform the electrical control according to the preset program.
Operating temperature	A temperature range in which the auto switch can be used.  If significant temperature change or freezing occurs even within this temperature range, it may cause the auto switch to malfunction.
Operating voltage	A voltage at which the auto switch can be used.  The operating voltage is indicated using generally used voltages (24 VDC, 100 VAC, etc.).  For the 2-wire type, the operating voltage has the same meaning as the power supply voltage or load voltage.
Operating current range	A range of the current value that can be flowed to the output of the auto switch.  If the operating current is lower than this range, the auto switch may not operate correctly. Conversely, if the operating current is higher than this range, the auto switch may break.
Current consumption	This current value is necessary for the 3-wire type auto switch to operate the circuit through the power cable. For the 2-wire type, as the current consumption is a part of the load current, it is not defined.
Insulation resistance	A resistance between the electric circuit and enclosure. Unless otherwise specified, $50\mathrm{M}\Omega$ (Min) is used for auto switches.
Magnetic field resistant auto switch	An auto switch with protection against the effects of external (welding) magnetic fields generated in the spot welding process, etc.  The solid state auto switch is able to function as it detects the frequency of the applied magnetic field. If an external magnetic field (AC) is applied, the last signal is retained and the product remains unaffected by the external magnetic field. This system can be used with cylinders with normal magnetic force.  The reed auto switch features a built-in magnetic field shielded sensor with low sensitivity that reduces the effects of external magnetic fields (DC or AC magnetic fields). Therefore, a dedicated cylinder with a strong built-in magnet needs to be selected, and the operable range (conditions) need to be considered.
Impact resistance value	A minimum acceleration that may cause the auto switch to malfunction or break when the standard impact is applied.
Water-resistant auto switch	In contrast with the general (general purpose) product, structural measures have been taken in order to provide this model with long-term water resistance.
Withstand voltage	A tolerated dose of voltage that can be applied to the portion between the electrical circuit and enclosure.  The withstand voltage shows the strength level of the product against the voltage. If a voltage exceeding the withstand voltage is applied, it may cause the product to break. (The voltage described here is different from the power supply voltage necessary to operate the product.)
Proper mounting position	A dimension that shows the mounting position when the position is detected at the stroke end of the cylinder. When this position is set, the maximum sensitivity position is aligned with the center of the magnet. However, make the necessary adjustments to the actual machine by considering the characteristic differences of the actual setting. When an adjustment allowance is needed for the detection before the stroke, set a value with an adjustment allowance added to the proper mounting position.
Applicable load	A device that is assumed as a target load of the auto switch.
Operating time	A period of time until the auto switch output becomes stable after the magnetic force to operate the auto switch has been received.
Operating range	An auto switch operating range in response to the cylinder piston movement (ON length in response to the stroke). The operating range is determined by the magnetic force of the magnet (range in which the magnetic force acts) and switch sensitivity. So, the operating range may vary as these conditions can change according to the ambient environment, etc. The operating range in the standard status (normal temperature, single cylinder, magnetic force, sensitivity, etc.) is described in the catalog.

# **Prior to Use**Auto Switches Common Specifications 3

Refer to the Auto Switch Precautions on pages 14 to 18 before using auto switches.

Term	Meaning
Minimum stroke for auto switch mounting	A minimum stroke value of the auto switch that can be mounted on the cylinder.  The minimum stroke is determined by the specification limit (auto switch operation, position setting ability, etc.) and physical limit (mechanical interference associated with the auto switch mounting).  Note that the catalog shows the value assuming that the position detection is performed at the stroke end and that this value does not consider the adjustment allowance.
	When an adjustment allowance is needed, such as for detection before the stroke, set the value so that this adjustment allowance is added to the minimum stroke.
Internal voltage drop	A voltage that is applied to the portion between the COM and signal line when the auto switch is ON. As only the value of the power supply voltage subtracted by the internal voltage drop is applied to the input side of the PLC, a detection fault (incorrect input) may occur if this value is lower than the minimum operating voltage. So, take great care when selecting a device.
2-color indicator	As the end part of the auto switch operating range (boundary between ON and OFF) is an area that is susceptible to external disturbances or stroke changes during cylinder operation, this function is intended to quickly and properly make the settling at the center of the operating range where stable operation can be obtained by changing the operation indication color of the auto switch.
Load	A device that is connected to the output of the auto switch in order to do any work is called a "load." For example, the load may be a relay, PLC, etc. To check the operation of the auto switch, a device equivalent to a load (such as a resistor, etc.) must be connected.
Load current	A current that flows to the load when the ON-OFF output is ON.
Enclosure	A class of protection against the entry of water or solids for electrical machinery and apparatus as specified in the IEC60529 Standard.
	Second characteristic numeral  First Characteristic: Degree of protection against solid foreign objects  Non-protected Protected against solid foreign objects of 50 mm ø and greater Protected against solid foreign objects of 12 mm ø and greater Protected against solid foreign objects of 12 mm ø and greater Protected against solid foreign objects of 2.5 mm ø and greater Dust-protected Dust-protected Dust-tight  Second Characteristic: Degree of protection against water  Non-protected Non-protected Protected against vertically falling water drops Protected against vertically falling water drops when enclosure is tilted 15° Protected against vertically falling water drops when enclosure is tilted 15° Protected against vertically falling water is tilted up to 60°
	3 Protected against rainfall when enclosure is tilted up to 60° 4 Protected against splashing water
	5 Protected against water jets
	6 Protected against powerful water jets
	7 Protected against the effects of temporary immersion in water
	Protected against the effects of continuous immersion in water  Example) In the case of products stipulated as IP65, we can know the degree of protection is dust-tight and water jetproof on the grounds that the first characteristic numeral is 6 and the second characteristic numeral is 5. Therefore, we can assume it will not be adversely affected by direct water jets from any direction.
Solid state auto switch	A switch that uses an MR element to detect magnetic fields and possesses an internal judgement circuit that is able to output an ON/OFF signal like a transistor regardless of mechanical contact or non-contact (such as when there is no point of contact).
Leak current	A current that flows to operate the internal circuit when the ON-OFF output is OFF. In particular, if the leak current exceeds the detection current in the 2-wire type auto switch or PLC, it may cause a reset failure. So, take great care when selecting a device.
Reed auto switch	A switch that uses a reed switch to detect magnetic fields and output an ON/OFF signal when there is mechanical contact or non-contact (when there is a point of contact, such as with a relay or limit switch).
Induction load	A load that has a coil. The connection target of the auto switch is a relay.
Recommended lead wire bending radius	A minimum bending radius (reference value) of the lead wire when the lead wire is secured and constructed (oscillation or rotation is not considered).  (As the temperature and current value conforms to the auto switch specifications, this lead wire bending radius differs from the value disclosed by the electric wire manufacturer.)
Electrical entry	A structure in which the lead wire of the auto switch is taken out in the horizontal direction when the cylinder is laid out horizontally (cylinder rod is horizontall) is called an "in-line entry." A structure in which the lead wire is taken out in a direction perpendicular to the cylinder axis center is called a "perpendicular entry."

#### <Applicable switch models>

D-A7/A8, D-A7 H/A80H, D-A73C, A80C, D-C7/C8, D-C73C/C80C, D-E7 A. E80A. D-Z7/Z8. D-9/9 A. D-A9/A9 V. D-A79W

The auto switches above do not have a built-in contact protection circuit. A contact protection box is not required for solid state auto switches due

to their construction.

- 1. Where the operation load is an inductive load
- 2. Where the wiring length to the load is 5 m or more
- 3. Where the load voltage is 100/200 VAC

Use a contact protection box with the switch for any of the above cases.

The contact life may be shortened (due to permanent energizing conditions). D-A72(H) must be used with the contact protection box regardless of load types and lead wire length since it is greatly affected by loads. (Where the load voltage is 110 VAC)

When the load voltage is increased by more than 10% of the rating of the applicable auto switches (Exceptions: D-A73C/A80C/C73C/C80C/90/97/ A79W) above, use a contact protection box (CD-P11) to reduce the upper limit of the load current by 10% so that it can be set within the range of the load current range, 110 VAC

Even for the built-in contact protection circuit type (D-A34[A][C], D-A44[A][C], D-A54/A64, D-A59W, D-B59W), use the contact protection box when the wiring length to the load is very long (30 m or more) and when a PLC (Programmable Logic Controller) with a large inrush current is used.

#### Contact Protection Boy Specifications

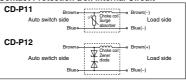

Blue(-)

Part no.	CD-	P11	CD-P12	
Load voltage	100 VAC or less	200 VAC	24 VDC	
Max. load current	25 mA	12.5 mA	50 mA	-

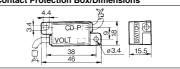

Lead wire length — Auto switch connection side 0.5 m Load connection side

#### **Contact Protection Box Internal Circuit**

#### **Contact Protection Box/Dimensions**

#### **Contact Protection Box Connection**

To connect a switch unit to a contact protection box, connect the lead wire from the side of the contact protection box marked SWITCH to the lead wire coming out of the switch unit. Keep the switch as close as possible to the contact protection box, with a lead wire length of no more than 1 meter

### **Prior to Use Auto Switch Connections and Examples**

#### Sink Input Specifications

#### 3-wire, NPN

#### 2-wire

#### Source Input Specifications

#### 3-wire, PNP

#### 2-wire

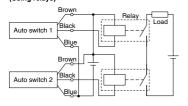

Connect according to the applicable PLC input specifications, as the connection method will vary depending on the PLC input specifications.

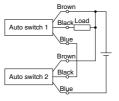

#### Examples of AND (Series) and OR (Parallel) Connections

When using solid state auto switches, ensure the application is set up so the signals for the first 50 ms are invalid. Depending on the operating environment, the product may not operate properly.

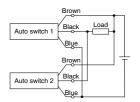

#### 3-wire AND connection for NPN output (Using relays)

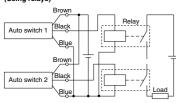

#### (Performed with auto switches only)

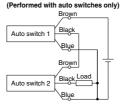

#### 3-wire OR connection for NPN output

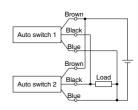

#### 3-wire AND connection for PNP output (Using relays)

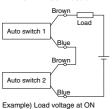

#### 3-wire OR connection for PNP output

#### 2-wire AND connection

Power supply voltage: 24 VDC

When two auto switches are connected in series, a load may malfunction because the load voltage will decline when in the ON state.

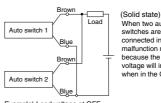

The indicator lights will light up when both of the auto switches are in the ON state. Auto switches with a load voltage less than 20 V cannot be used. Please contact SMC if using AND connection for a heat-resistant solid state auto

Internal voltage drop: 4 V Load voltage at ON = Power supply voltage

Auto switch internal voltage drop x 2 pcs. = 24 V - 4 V x 2 pcs.

= 16 V

#### 2-wire OR connection

When two auto switches are connected in parallel, malfunction may occur because the load voltage will increase when in the OFF state.

Example) Load voltage at OFF Leakage current: 1 mA Load impedance: 3 kΩ

Load voltage at OFF = Leakage current x 2 pcs. x Load impedance = 1 mA x 2 pcs. x 3 kΩ

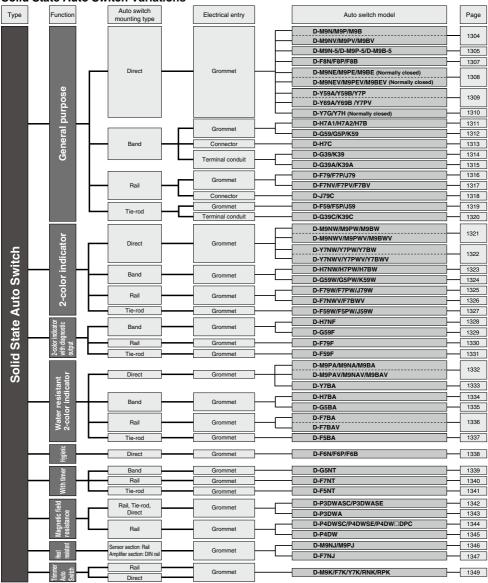

Because there is no current leakage, the load voltage will not increase when turned OFF. However, depending on the number of auto switches in the ON state, the indicator lights may sometimes grow dim or not light up, due to the dispersion and reduction of the current flowing to the auto switches.

### **Solid State Auto Switches**

General Purpose Type, 2-color Indicator, 2-color Indicator with Diagnostic Output, Water Resistant 2-color Indicator, Hygienic Type, Timer Equipped Type, Magnetic Field Resistant Type, Heat Resistant Type, Trimmer Auto Switch

#### **Solid State Auto Switch Variations**

### **Solid State Auto Switch Direct Mounting Type** D-M9N(V)/D-M9P(V)/D-M9B(V)

#### Grommet

- 2-wire load current is reduced (2.5 to 40 mA).
- Using flexible cable as standard

#### **∆Caution**

#### **Precautions**

Fix the auto switch with the existing screw installed on the auto switch body. The auto switch may be damaged if a screw other than the one supplied is used.

#### Auto Switch Specifications

Refer to SMC website for the details of the products conforming to the international standards.

# **Timer Operation**

### Detection of intermediate positioning for high-speed cylinder

Detecting point dispersion occurs due to response time of PLC (sequencer); e.g. scanning.

Ex.) Cylinder speed — 1000 mm/sec. PLC response time — 0.1 sec. Detecting point dispersion — Within 100 mm (= 1000 mm/sec. x 0.1 sec.) Table PLC response time into consideration when using.

• It is possible to use in an

environment which generates a magnetic field disturbance (AC magnetic field).

The proper operating range can be determined by the color of the light.

# **∆**Caution

#### Precautions

For single-phase AC welding machines. If it is used for current inverter welders (including rectifying type) and condenser type welders, the magnetic field resistance is reduced. Please contact SMC regarding the performance.

# **Magnetic Field Resistance**

If the current of the AC welding machine is 16000 A or lower, the auto switch can be used, even if the distance between the welding conductor (gun cable) and the cylinder/actuator or auto switch is 0 mm.

Please contact SMC when the AC welding current exceeds 16000 A.

# Heat Resistant 2-Color Indicator Solid State Auto Switch: Direct Mounting Type

D-M9NJ/D-M9PJ

# Grommet

 Improved heat resistant type
 The proper operating range can be determined by the color of the light. (Red → Green ← Red)

# <u> ⚠</u>Caution

### **Precautions**

This auto switch can be mounted on the cylinder with heat resistant auto switch (-XB14) and is not applicable to the heat resistant cylinder (-XB6) since a magnet is not built in it.

Do not disconnect the cable between the sensor and amplifier by the customer.

Even when the sensor and amplifier are connected again, a contact resistance is produced, causing the auto switch to malfunction. Additionally, the sensor and amplifier are paired and they do not operate correctly in different combinations.

# **Auto Switch Specifications**

Refer to SMC website for the details of the products conforming to the international standards.

# Made to Order Specifications: Solid State Auto Switch -50: Without Indicator Light (Dark room) Specifications -61: Oilproof Flexible Heavy-duty Cord Specifications

2 Without Indicator Light (for dark room specifications)

-50

Possible to use under the environment which hates a light.

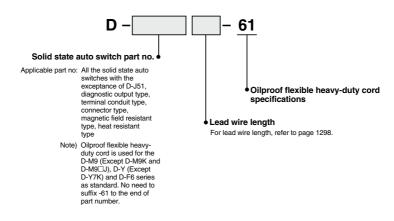

Dimensions and specifications are common as standard products with the exception of no indicator light.

# 3 Oilproof Flexible Heavy-duty Cord Specifications

Symbol -61

This is the product which uses a heavy-duty cord having flexible characteristics 5 times (SMC comparison) as strong as oilproof heavy-duty cord used in the standard products.

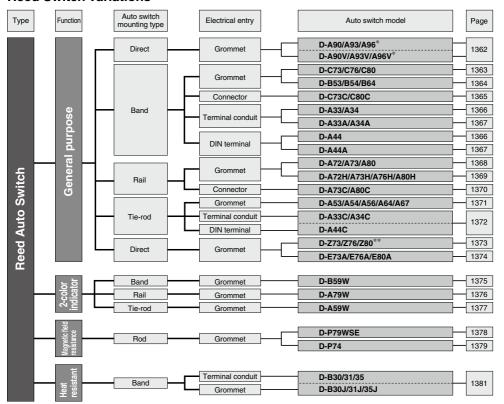

Dimensions are identical with D-F5 type, G5 type, J59 type, K59 type. Lead wire diameter is changed from ø4 to ø3.4. In other series products, it is common as standard product's specifications.

# **Reed Auto Switches**

General Purpose Type, 2-Color Indicator

# **Reed Switch Variations**

<sup>\*</sup> Auto switches with an asterisk (\*) can be mounted on a band (excluding D-A9□V), rail, tie-rod or square groove with an auto switch mounting bracket. Refer to pages 1386, 1390, 1394 and 1401 to 1403 for details.

<sup>\*\*</sup> This auto switch can be mounted by tie-rod with using auto switch mounting bracket. For details, refer to page 1397.

# **Reed Auto Switch Direct Mounting Type** D-A90(V)/D-A93(V)/D-A96(V) (€ UK

# Grommet D-A93 D-A90 (V) D-A93V D-A96 (V)

# **.** Caution

#### **Precautions**

- 1. Do not drop or bump the auto switch while handling it as it may result in the auto switch breaking.
- 2. Do not remove the protective cover attached to the product body until the product is ready to be mounted on the actuator
- 3. Fix the auto switch with the existing screw installed on the auto switch body. The auto switch may be damaged if a screw other than the one supplied is used.

# Grommet

# ∧Caution

#### **Precautions**

- 1. Do not drop or bump the auto switch while handling it as it may result in the auto switch breaking.
- 2. Do not remove the protective cover attached to the product body until the product is ready to be mounted on the actuator
- 3. Fix the auto switch with the existing screw installed on the auto switch body. The auto switch may be damaged if a screw other than the one supplied is used.

# Heat Resistant Reed Auto Switch D-B30(J)/31(J)/35(J)

C € KK

Can be used outdoors or under high temperature (Max. 120°C). Wide operating range (double that of other SMC products) enables stable position detection.

High temperature environment such as places around ignited gas outlet or furnace

Outdoor plants and environment with high temperature and humidity

Environment for steam cleaning or high temperature sterilization

Applications requiring wide operating range such as clamping of elastic work pieces

Use of metal case and heat resistant materials. The construction prevents influence of external environment by sealing the auto switch internal parts to improve heat resistance.

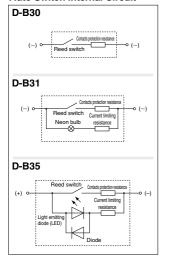

The wide operating range allows easy position setting and reduces influence of the work piece position changes.

#### <u> ⚠</u>Caution

#### **Precautions**

Do not drop or bump the auto switch while handling it as it may result in the auto switch breaking.

# **D-B3** Series Specific Product Precautions

Be sure to read this before handling the products.

Refer to page 8 for safety instructions and pages 14 to 18 for auto switch precautions.

### **↑** Caution

## 1. Use the reed switch within the operating range

Take precautions about the ambient temperature because using the reed switch beyond the operating range may affect its internal electronic parts and sealing construction, causing abnormalities to the service life of the contact, as well as operation and waterproof performance of the switch.

Also, the maximum temperature of the environment where the switch is used must be fully understood before operation is started because the temperature of the environment where the auto switch is installed may experience some changes after operation is started due to factors other than air temperature such as influence of radiation heat from the heat source, air circulation or heat conduction.

## 2. Take precautions about the environment where the auto switch is installed.

If conditions (water splashes, time, temperature) beyond the normal ranges can be applied to the auto switch, use the auto switch in an environment where it will not be directly exposed to water splashes at a high temperature by installing a cover to protect the entire auto switch, as long as it is possible. The grommet type auto switch has a construction that will protect its internal parts against water splashes at the normal temperature. However, if the conditions (water splashes, time, temperature) exceed the normal ranges, they may adversely affect the auto switch internal insulation performance.

Also, confirm the applicability of the auto switch in the environment because extreme heat cycles or a long-term high humidity may cause functional deterioration of the auto switch protection construction.

In principle, the terminal conduit type must be used in an environment with no exposure to humidity or water because at high temperatures, it may become impossible to achieve sufficient waterproof effect due to deformation of lead wire sealant depending on the heat resistance of the lead wire and cable clamp.

#### 3. Visibility of an indicator light

Because the auto switch uses light emitting diodes and neon bulbs for display, continuous operation at a high temperature may cause changes in characteristics of the entire display circuit. Also, the transparency of the display window on the body may change depending on the characteristics of the resin.

Because of the above factors, lighting under high temperature may become dark, causing decline of visibility.

However, there could be no problem in output of the signal itself and its safety owing to adoption of the OFF-state lighting system.

#### 4. Take precautions about leakage current.

According to the heat resistant characteristics of its parts, the auto switch adopts the OFF-state lighting system (the indicator light lights up when the reed switch contact is open and goes off when the reed switch contact is closed).

Since the current for indicator lighting is running when the auto switch is off, confirm the allowable leakage current of PLC etc. before selecting the model.

If the leakage current of the indicator light becomes a problem for the PLC operation, select a model without an indicator light.

## 5. Keep the lead wire length as short as possi-

If a long lead wire is used because of the conditions of the plant or equipment where the switch is installed, malfunction in the reed switch reset operation may occur due to premature damage to the contact surface caused by the inrush current resulting from the line flotation capacity and influence of the electric field created by the power line near the wiring.

Therefore, the maximum wiring length should be kept at 100 m or less.

Avoid wiring in proximity with the power line. Also, if the length of wiring in use is extremely long (30 m or longer), schedule replacement in periodical maintenance.

The basic guidelines for replacement are a total wiring length of 100 m between the load and the auto switch and 1 million cycles of operation (at  $120^{\circ}C$ ,  $100\ VAC\ PLC\ load$ ).

#### Install the auto switch at the center of the operating range.

The operation range of the auto switch is set at approximately double that of the standard type in consideration of the mounting error when the detection position is set. However, this range is subject to change with the temperature. Although the variation in the operating range differs with the cylinder on which the auto switch is mounted, a temperature change of 100°C will roughly result in the maximum of 20% reduction in the overall operation range.

(Approximately 2 mm variation at the position where the auto switch usually turns on)

Therefore, install the auto switch at the center of the operating range (stable range), while understanding the possible change in the operating range and considering the stability of the auto switch operation.

(Avoid installation of the auto switch at the boundary where the auto switch turns on or off.)

#### 7. Selection of applicable cylinders

The auto switch should be mounted on special cylinders (-X1184 series) because it is operated by magnets using heat resistant material.

Consult SMC in advance for special applications in which current cylinder cannot be used because, depending on the operating environment, it is possible that special measures should be taken or even the cylinder cannot be adapted.

#### 8. Maintenance

After the auto switch is installed under high temperature, apply additional tightening peiodically to the auto switch mounting band. The rubber lining of the auto switch mounting band may need some time to adapt to the environment because of temperature chages in the installation environment. Perform additional tightening at a tightening torque of 2 to 3 N·m while carefully applying equal torque to both lifting screws.

#### 9. Product upgrades

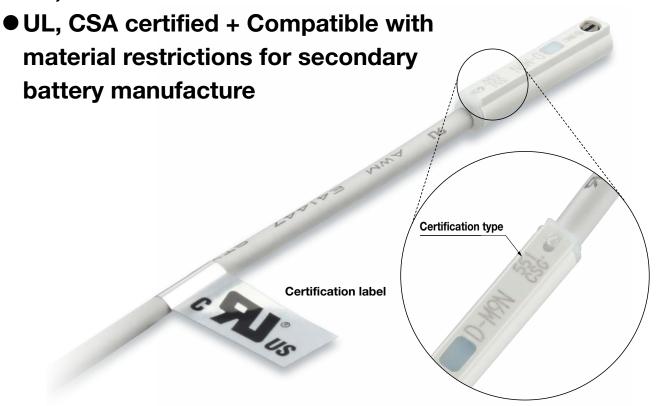

The product is subject to change without prior notice due to upgrades.
