Bag Filter

**FGF Series**

With safety mechanism

Employs proprietary SMC latch mechanism and band lock mechanism. Safe even in the event of erroneous operation.

Optimum for the large flow filtration

The bag-stated element (made of non-woven cloth) makes it possible to filtrate the large flow with lower pressure drop.

[FGF□1 Series (one element included): Up to 400 L/min]

Easy maintenance

Replacement operations are easy thanks to a built-in basket mechanism allowing element replacement outside the vessel.

Main operating fluids

- Coolant (oil-based, water-soluble)
- Weak alkali-based cleaning fluid
- Cutting fluid
- Industrial water

* For other kinds of fluids, please contact SMC.

Improved functionality and operability

Renewed for easier use!

[FGF□1 Series (one element included)]

- Leg format changed to removable type, improved piping workability on bottom side.
- Easier handling thanks to lightweight band and hinge mechanism.
- Basket features hole for fluid release. Release of foreign matter to the outlet side is prevented.
- Weight: 13 kg (Current model: 19 kg) 32% lighter than the current model
  * Applies to FGF□1A

With band-lock mechanism

With a bag configuration, the aperture is wide and foreign matter is captured inside the element for easy removal. Furthermore, foreign matter captured inside the element will not spill over into the case interior or the surrounding area.

Select from a wide range of filtration accuracy.

Nominal filtration accuracy

5, 10, 25, 50, 100 µm

BAG STATED ELEMENT

RoHS
Bag filter offers excellent safety performance and ease of maintenance.

**With safety mechanism**
Employs SMC proprietary latch mechanism – Prevents cover blowout in cases of erroneous operation.

**Element can be replaced outside the vessel.**
Use of a built-in basket mechanism makes it possible to replace the element outside the vessel.

**Band system**
Makes the work of tightening easy.
Compared to a bolt tightening system with many places (between 4 and 6) that need to be tightened, this system is easy to use with only one place to tighten.
Improved, easier handling thanks to lightweight band
Easier handling with more lightweight band (Band weight: 1 kg)
With lock mechanism – Patent pending
Safe lock mechanism prevents band from coming off even in cases of erroneous operation under internal pressure.

**No-fluid-buildup structure**
Basket features hole for fluid release. Release of foreign matter to the outlet side during element replacement is prevented.
Since there is no leftover fluid, there is no need to perform drainage operations.
(The drain port of the current model has been eliminated.)

**Lightweight**
32% lighter than the current model
Weight: 13 kg (Current model: 19 kg)
● Applies to FGF□1A

**Piping operations are a breeze.**
With a removable leg system, carrying out piping operations at the fluid release port is easier.

Example When removing legs from the main unit before attaching piping
1. Remove legs from the main unit.
2. Attach piping to fluid release port.
3. Replace legs on the main unit and attach piping to OUT port.

![Diagram of piping operations](image)

</tbody>
</table>

- **Bag element**: Effective for extending the service life of a standard element
- **Sub-element**: Eliminates large foreign matter.
- **HEPO element**: High-performance filtration
- **Long service life element**: Suitable for filtering cutting fluids

Note) Refer to pages 55 to 58 for details on Made-to-Order elements and vessels.
Stable quality and reuse of fluid is possible thanks to filtration!

Contributes to...

- Stable product quality
  (Fewer defects, etc.)
- Prevention of problems in the line
  (Prevention of nozzle blockage, etc.)
- Less waste fluid

Application example

**Washing line**

[Filtration of cleaning fluid]
The filter performs filtration of used cleaning fluid so it can be reused many times. (Thanks to cyclical filtration, the volume of waste fluid is reduced.)

[Filtration of industrial water]
The filter removes foreign matter from raw water so it can be used for manufacturing.

Maintenance example

Two units used side by side
[Reduction in length of time line is stopped for element replacement]
Installing two bag filters means that one filter can always be used while the other is undergoing element replacement, meaning that the line does not have to be stopped for long periods of time for replacement of elements.

[Application example]

**Stable product quality**
(Fewer defects, etc.)

**Prevention of problems in the line**
(Prevention of nozzle blockage, etc.)

**Less waste fluid**

**Filtration of cleaning fluid**
The filter is used to maintain a constant level of cleaning fluid.

**Filtration of coolant**
The filter performs filtration of used coolant so it can be reused many times.

**Filtration of industrial water**
The filter removes foreign matter from raw water so it can be used for manufacturing.
### Specifications

**Model**

<table>
<thead>

<td>FGF-3</td>
</tr>
</tbody>
</table>

**Common**

- **Operating pressure**: Max. 0.5 MPa
- **Operating temperature**: Max. 80°C (For with pressure gauge: 60°C or less)
- **Maximum flow rate**: Approx. 400 L/min
- **Applicable fluid**: Water-soluble coolant, Weak alkali-based cleaning fluid, Industrial water (Vessel material: Stainless steel)
- **Material**: Stainless steel 304 (Note 6)
- **Material**: FGF/L or FGF/R
- **Vessel**
  - **Port size**: Rc2
  - **Internal volume**: 23 L, 35 L, 104 L, 156 L, 214 L, 307 L
  - **Weight**: 13 kg, 16 kg, 170 kg, 210 kg, 270 kg, 315 kg
- **Element**
  - **Nominal filtration accuracy**: 5, 10, 25, 50, 100 μm
  - **Pressure gauge**: 1 MPa: Brass for wetted parts
  - **Pressure release valve**: 1/4" Ball valve (Brass)
  - **Handle for picking elements**: Basket integrated
  - **Davit for cover**: Part No.: AK-1S
  - **Seal**: NBR or FKM

**Part number for replacement**

- **Material**: Polyester
- **Element size**: ø190 x L440, ø190 x L770
- **Applicable model**: FGF-1A, FGF-3B

**Accessories**

- **Handle for picking elements**: Basket integrated
- **Davit for cover**: Part No.: AK-1S
- **Pressure release valve**: 1/4" Ball valve (Brass)

---

1) **Conditions**: Fluid = Water, Pressure drop = 7 kPa, Nominal filtration accuracy = 100 μm
2) **Confirm the conformity of the fluid to be used**.
3) **Surface treatment No. 20** applies to the external surface of the vessel. (Scratches, scrapes, blisters and uneven color may be present as long as they do not interfere with function or performance.)
4) **For the FGF-1 series**, this indicates cases where the "with pressure gauge" option has been selected.
5) **Control the element replacement so that the differential pressure does not exceed 0.1 MPa**.
6) **Parts other than the wetted parts are made of carbon steel and painted (silver)**.
7) **Please contact SMC for delivery time as the FGF-3 series has been selected**.

---

**Note 1)** Conditions: Fluid = Water, Pressure drop 7 kPa, Nominal filtration accuracy 100 μm

**Note 2)** Confirm the conformity of the fluid to be used.

**Note 3)** Surface treatment No. 20 applies to the external surface of the vessel. (Scratches, scrapes, blisters and uneven color may be present as long as they do not interfere with function or performance.)

**Note 4)** For the FGF-1 series, this indicates cases where the “with pressure gauge” option has been selected.

**Note 5)** Control the element replacement so that the differential pressure does not exceed 0.1 MPa.

**Note 6)** Parts other than the wetted parts are made of carbon steel and painted (silver).

**Note 7)** Please contact SMC for delivery time as the FGF-3 series has been selected.
Checking operating conditions

- Fluid
- Pressure
- Temperature
- Flow rate
- Filtration accuracy

Confirm that the specifications are within the appropriate range.

Check the compatibility of fluid with element material [polyester].

To check the compatibility with main fluids, refer to “Selection by Main Application” on page 50.

Check the compatibility of fluid with vessel material [stainless steel 304/carbon steel].

To check the compatibility with main fluids, refer to “Selection by Main Application” on page 50.

Check the compatibility of fluid with seal material [NBR] or [FKM].

To check the compatibility with main fluids, refer to “Selection by Main Application” on page 50.

Confirm that the temperature is 80°C or less.

Confirm that the pressure is 0.5 MPa or less.

Selection method

Selection flow chart

Selection example

Operating conditions
- Fluid: Coolant (water-soluble) [Viscosity equivalent to water: 1 mPa·s]
- Pressure: 0.3 MPa
- Temperature: 50°C
- Flow rate: 700 L/min
- Filtration accuracy: 50 µm

Confirm that the specifications are within the appropriate range.

Fluid: Coolant (water-soluble) → Compatibility with polyester: OK

→ Compatibility with stainless steel 304: OK

→ Compatibility with NBR (FKM): OK

- 50°C → 80°C or less: OK
- 0.3 MPa → 0.5 MPa or less: OK

Consider Made-to-Order products.

Check fluid/pressure/temperature/flow rate/filtration accuracy.

Element material

Compatibility of fluid with polyester

Vessel material

Compatibility of fluid with stainless steel 304/carbon steel

Seal material

Compatibility of fluid with NBR or FKM

Temperature

80°C or less

Pressure

0.5 MPa or less

OK

Possible range of pressure specifications up to 1.0 MPa

Consider special products.
Step 2 Selecting a vessel

1. Calculating the number of elements
   - Use the flow rate to calculate the number of elements.
   - Required flow rate = Recommended flow rate × Number of elements.
   - [Recommended flow rate per one element] 400 L/min (Pressure drop 7 kPa to 8 kPa)
     - When viscosity rate is equivalent to water.
   - [Number of elements] Round up: 1.75 elements ≈ 2 elements
     - When flow rate = 50 L/min or less, the compact filters [FGD] [FQ] series are recommended.

2. Vessel type and number of units
   - Choose a vessel that satisfies the number of elements obtained in step 1.

Step 3 Selecting the filter model

1. Selecting vessel material and seal material
   - Select vessel and seal materials from among those compatible with the fluid used.

2. Selecting element size
   - Select the element size when there is a large amount of contamination or frequent replacements.
   - Flow rate does not change depending on element size.

3. Selecting filtration accuracy
   - Select the required filtration accuracy depending on conditions.
   - Filtration accuracy = Nominal filtration accuracy

Step 4 Determining the model and number of units

Determine the filter model and number of units based on the results of Step 2 and Step 3.

Selecting the number of elements.
- Required flow rate = Recommended flow rate
- 700 L/min ÷ 400 L/min = 1.75 ≈ 2 elements

Choose the vessel type and number of units.
- 2 elements → FGF1-20 → 2 units

Select vessel material and seal material

Selecting the filter model

Selecting vessel, seal material, and element size

Selecting filtration accuracy

Nominal filtration accuracy of 5, 10, 25, 50, 100 µm can be selected.

Select the filter model and number of units based on compatibility with the fluid.
- Coolant (water-soluble) → Stainless steel / NBR: OK
- The model selected is the FGF1-20.
  - In this case, the FGF1-20 with FKM seal material can also be selected.

Select the element size.
- With standard life, the model selected is the FGF1A-20.
  - When there is a large volume of contaminants in the fluid or when you want to reduce the frequency of replacements, select the FGF1B with the L770 size element with 1.7 times longer life.

Select the filtration accuracy.
- With a nominal filtration accuracy of 50 µm, the model selected is the FGF1A-20E 050 B.

Based on the results of Step 2 and Step 3, 2 units of the FGF1A-20E050B are selected.
Flow Rate Characteristics (Initial Value)

- Test fluid: Water  Liquid temperature: 17°C to 20°C (Room temperature)
- Test method: Per SMC test method

Flow rate conversion based on viscosity conversion (with viscosity other than that equivalent to water)

Example Fluid: Coolant (oil-based)  Kinematic viscosity: 20 mm²/sec  Flow rate: 285 L/min

1) Calculation of flow coefficient
   - Obtain the flow coefficient from the viscosity conversion table.  Kinematic viscosity: 20 mm²/sec → Flow coefficient: 95%

2) Flow rate conversion
   - Convert the flow rate when viscosity is equivalent to water using the flow coefficient obtained in step 1.  285 L/min ÷ flow coefficient 95% = 300 L/min
   - 300 L/min flow rate is necessary when viscosity is equivalent to water.
   - After this, make a selection using the selection method.

Flow rate is the appropriate flow rate at a viscosity equivalent to water.

Note 1) Please contact SMC for delivery time as the FGF3 and FGF5 are produced upon receipt of order.

Viscosity Conversion Table

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

* These relationships between fluids and kinematic viscosity are for guideline purposes only.  Check the actual kinematic viscosity of fluid before using.  Fluid viscosities shown are at room temperature (17°C to 20°C).

* Flow coefficient: When 100% of water flows at 1 mm²/sec, the flow coefficient indicates that 85% flows at a kinematic viscosity of 100 mm²/sec.

</table>

- **X46**: Effective for extending the service life of a standard element
- **X81**: Eliminates large foreign matter.
- **X49**: High-performance filtration
- **X82**: Long service life (Four to five times the filtration area compared with the standard elements)

### Branch type element

- **X292**: More compact vessel is possible. (Filtration area for L440 is same as L770.)

### PP (Polypropylene) bag element

- **X72**: Applicable for strong alkali-based cleaning fluid

### Filter paper element

- **X142**: Suitable for filtering cutting fluids

### Leg Material: Stainless Steel

- **X47**: Made to Order (For coarse filtration)

---

**Effective for extending the service life of a standard element**

**Eliminates large foreign matter.**

**High-performance filtration**

**Long service life (Four to five times the filtration area compared with the standard elements)**

**More compact vessel is possible. (Filtration area for L440 is same as L770.)**

**Applicable for strong alkali-based cleaning fluid**

**Suitable for filtering cutting fluids**

**Made to Order (For coarse filtration)**
**FGF Series**

**Made to Order**

Please consult with SMC for details.

---

**X46**  
"Sub-element and Standard element" equipped

- Effective for extending the service life of a standard element
- Sub-elements eliminate large foreign matter.

(For coarse filtration)

It has a structure such that the spongiform filtration material, which is made of Polyvinylidene Chlorides, is in the form of a bag. It is then fixed by a ring inside the standard element.

---

**How to Order**

- Refer to “How to Order” on page 47 for standard specifications.

<table>
<thead>
<tr>
<th>Sub-element/Ring Part No.</th>

</tbody>
</table>

---

Note 3) Fluids that cause corrosion, deterioration or expansion of the material used in the elements cannot be used.

Note 4) Depends on the filtration accuracy (nominal filtration accuracy) of the element.

Note 5) Conditions: Fluid = Water, Initial differential pressure 7 kPa, Nominal filtration accuracy 100 µm (standard element), 500 to 1000 µm (sub-element)

(For other conditions, refer to “Flow Rate Characteristics” on page 50. Equivalent to standard element) Maximum flow rate is per one element. When there are three elements or five elements, multiply by 3 or 5.
**FGF Series**

### X49 HEPO element equipped
- High-performance filtration
- Optimum for filtration of precision machine fluids, precision cleaning fluids, etc.
- Effective for the grinding powders

A cylindrical element in which the filter material made of P.G.P. (Polyester + Glass fiber) is sandwiched by a stainless steel mesh and pleated.

Note 4) Fluids that cause corrosion, deterioration or expansion of the material used in the elements cannot be used.

Note 5) Specialized for precision filtration. The filtration accuracy indicates 98% of filtered particle size.

Note 6) Conditions: Fluid = Water. For other fluids, maximum flow rate changes based on viscosity, etc. Maximum flow rate is per one element. When there are three elements or five elements, multiply by 3 or 5.

### X82 Long service life element equipped
- Four to five times the filtration area (compared with the standard elements)
- Reduction in number of element replacements

A cylindrical element in which the non-woven material made of PP (Polypropylene) is sandwiched by a PET (Polyester) mesh and pleated.

Note 4) Fluids that cause corrosion, deterioration or expansion of the material used in the elements cannot be used.

Note 5) The filtration accuracy is based on SMC criteria, and differs from the absolute filtration accuracy (filtration efficiency of 97% or more).

Note 6) Conditions: Fluid = Water. For other fluids, maximum flow rate changes based on viscosity, etc. Maximum flow rate is per one element. When there are three elements or five elements, multiply by 3 or 5.

---

**How to Order**

**Note 1)** Without pressure gauge/Without option: “-” is not required to enter.

**Note 2)** When changing from a standard product to one with X49 specifications, additionally order a HEPO element (single part) and an element-fixing component. Since the model number will change when replacement is conducted, we ask that the customer manage the model number. When replacing only the element, order a HEPO element (single part).

**Note 3)** 1 set is required per element.

**Note 4)** Fluids that cause corrosion, deterioration or expansion of the material used in the elements cannot be used.

**Note 5)** The filtration accuracy is based on SMC criteria, and differs from the absolute filtration accuracy (filtration efficiency of 97% or more).

**Note 6)** Conditions: Fluid = Water. For other fluids, maximum flow rate changes based on viscosity, etc. Maximum flow rate is per one element. When there are three elements or five elements, multiply by 3 or 5.

57®
**FGF Series**

**X142** Filter paper element equipped

- Optimum for filtration of cutting or grinding oil
- Large filtration area makes it suitable for filtering fluids containing highly dense contaminants.

A cylindrical element with a cotton-made filter inside and a pleated material on the outside for reinforcement.

Note 4) Fluids that cause corrosion, deterioration or expansion of the material used in this filter and elements cannot be used.

Note 6) Conditions: When fluid has a kinematic viscosity of 36 mm²/sec (equivalent to turbine oil VG36).

When replacing only the element, order a filter paper element (single part) and an element-fixing component. Since the model number will change when replacement is conducted, we ask that the customer manage the model number.

Note 3) 1 set is required per element.

Ex.) When using 3 elements, order 3 sets.

---

**How to Order**

Refer to "How to Order" on page 47 for standard specifications.

<table>
<thead>
<tr>
<th>1 element included</th>
<th>FGF 1A - 20 - Z 010 B - X142</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/5 elements included</td>
<td>FGF 1A - 20 - Z 010 X142 (Produced upon receipt of order.)</td>
</tr>
</tbody>
</table>

Note 1) Without pressure gauge/Without option: "-" is not required to enter.

Example) FGF1A-20-Z010B-X142, FGF3B-40-Z010X142

Note 3) Conditions: Fluid = Water, Initial differential pressure 7 kPa, Nominal filtration accuracy 100 µm (standard element)

For other conditions, refer to "Flow Rate Characteristics" on page 50. Equivalent to standard product.

Note 4) Fluids that cause corrosion, deterioration or expansion of the material used in this filter and elements cannot be used.

Note 5) Depends on the filtration accuracy (nominal filtration accuracy) of the element.
FGF Series
Specific Product Precautions

Do not select a model exceeding specification ranges and carefully consider the purpose of use, required specifications and operating conditions such as fluid, pressure, flow rate, temperature and environment. Mishandling may lead to an unexpected accident.

⚠️ Warning

1. Operating pressure
Do not use the product beyond the operating pressure range. Do not use in locations where peak pressure exceeds the operating pressure due to water hammer, surge pressure, etc.

2. Operating temperature
Do not use the product beyond the operating temperature range. Do not use at temperatures at or above the boiling point of the fluid.

3. Fluid
- Use the product for filtering coolant (oil-based or water-soluble), weak alkali-based cleaning fluid or industrial water.
- Never use the product with gases.
- Do not use the product with corrosive fluids.
- Do not use the product with fluids which will likely cause the expansion and deterioration of seals, O-rings or the element. Some fluids can deteriorate a seal or an O-ring, and have an affect on the filter function, causing leakage.
- The wetted parts of the pressure gauge is made of brass. Check the compatibility with fluid in use.

4. Operating environment
- Do not use in operating conditions or environments where changes in color or deterioration of material due to corrosion occur.
- Do not use this product in a place where shock or vibrations occur.

⚠️ Caution

1. Pressure drop ($\Delta P$)
- Use the product with a flow which has an initial pressure drop which will become 10 kPa or less.
- The pressure drop fluctuates depending on operating conditions. Since the pressure drop is one of the factors indicating filter characteristics, use the filter by setting a controlling standard.

2. Installation space
Arrange the necessary space for inspection, before installing and piping the product.
[Maintenance work space]
- Above vessel (for removal of basket during element replacement) ... At least 450 mm of space above vessel
- Around band (for removal of band during element replacement) ... At least 50 mm of space around band
- Applies to FGF/C/BN/

3. Fluid release port
Be sure to connect the pipe to the fluid release port so that fluid releasing work can be absolutely performed.

4. Pipe
- Pipe so that air releasing work can be absolutely performed.
- The air releasing work can be done firmly if you make the piping in order to flow a small flow constantly into a tank by resin tubing, etc. from the air release valve. (Refer to Fig. 2.)
- However, because the pump is in a high position, idling sometimes occurs during re-start. Take measures such as releasing the air in a high position, etc.

5. Cleaning each component
- During element replacement, in order for firm sealing to take place, clean the sealing surface of the seal and/or remove the paint which is left on the tightened parts of the cover or the thread parts.

6. Temperature
When operating at high temperatures (40°C to 80°C), there is danger of burns, etc. Confirm that the surface temperature of the filter or the parts for operation (V-band, element, etc.) are 40°C or less, to prevent a burn from occurring.

⚠️ Caution

1. Use the product with a circuit having lesser fluctuation to the filter caused by pressure or flow. (Refer to Fig. 1.)

2. Use the product in a circuit where no backflow occurs in the filter. If any backflow occurs, take appropriate measures, such as installation of a non-return valve. The riser piping at the outlet of the filter may also cause backflow. So, take appropriate measures shown above.

3. Firmly fix the bottom to the ground using foundation bolts, etc.

4. Connect the valves or fittings suited to the operating conditions by checking the size of each connection port. During connection work, make sure that powder from the piping screws or seal material does not get into the interior of the piping. Prior to operating, flush the piping line and check for abnormalities, such as fluid leakage.

5. Firmly fix the piping to the mounting frame using a saddle, etc., to avoid vibration or force caused by the weight.

6. During element replacement, it is necessary to release fluid from the vessel. Be sure to connect the pipe to the fluid release port so that fluid releasing work can be absolutely performed.

7. Pipe
- Pipe so that air releasing work can be absolutely performed.
- The air releasing work can be done firmly if you make the piping in order to flow a small flow constantly into a tank by resin tubing, etc. from the air release valve. (Refer to Fig. 2.)
- However, because the pump is in a high position, idling sometimes occurs during re-start. Take measures such as releasing the air in a high position, etc.

⚠️ Warning

1. Never loosen the V-band under pressurized conditions.

⚠️ Caution

1. Releasing the air
When applying pressure for starting a pump, etc., be sure to release the air by opening the air release valve on the top. (Refer to Fig. 3.)

2. When operating
When applying pressure for starting a pump, etc., confirm that each connecting parts are completely sealed. If any abnormality is found, such as fluid leakage, stop the product immediately and locate the possible cause of the failure. Resume operation after taking appropriate measures to stop the fluid leakage by replacing the O-rings or additionally tightening the fittings, etc.

⚠️ Warning

1. Failure to observe the procedure will likely cause fluid leakage or removal of a cover, which may lead to an unexpected accident. (Follow the procedure in the operation manual.)

2. Confirm that the line has stopped and pressure has been reduced to zero before performing maintenance work.

⚠️ Caution

1. Timing of element replacement
When the time has come to replace the element, replace it with a new element immediately.
- Timing of element replacement =
- When pressure drop has reached to 0.1 MPa.

2. Element replacement work
- Carry out element replacement work based on the procedure in the operation manual.
- Mishandling could lead to malfunction or damage the machinery and equipment.
- Replace the elements only after confirming that the pressure is zero.
- The parts used for tightening the cover (V-band, etc.) must be properly positioned after replacing elements.

3. Cleaning each component
During element replacement, in order for firm sealing to take place, clean the sealing surface of the seal and/or remove the paint which is left on the tightened parts of the cover or the thread parts.

4. Replacing seals
Replace the deteriorated or expanded O-ring, gasket holder assembly or other seals.
Also, replace the seal after it has been used for one year or when fluid leakage occurs.

5. Parts used for tightening the cover
If a part used for tightening the cover (V-band, etc.) is deformed or the threads are galled, it must be replaced.

6. Temperature
When operating at high temperatures (40°C to 80°C), there is danger of burns, etc. Confirm that the surface temperature of the filter or the parts for operation (V-band, element, etc.) are 40°C or less, to prevent a burn from occurring.
