Aluminum High Vacuum Angle Valve

XL Series

The production of flange sizes 16, 25, 40, 50, 63, and 80 for the XLA(V)/XLC(V)/XLF(V)/XLG(V) series has been discontinued. Please select the new XL□-2 type. See here for details.

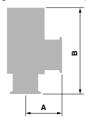

SMC

Aluminum High Vacuum Angle Valve

L Series

Lightweight, Compact

Large conductance, small body Excellent resistance against fluorine corrosion (body)

XI * Sprips Case

AL OCIOS OUSC				
Model	A * (mm)	B (mm)	Weight (kg)	Conductance* (L/s)
XLA-16	40	103	0.25	5
XLA-25	50	113	0.45	14
XLA-40	65	158	1.1	45
XLA-50	70	170	1.6	80
XLA-63	88	196	2.9	160
XLA-80	90	235	5.0	200
XLA-100	108	300	10.6	300
XLA-160	138	315	18.5	800

^{*} Common to all series.

Low outgassing makes it possible to use a lower capacity pump and also to shorten evaluation time

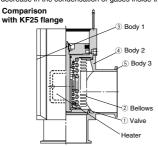

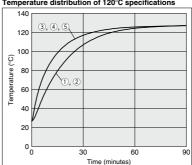

Little heavy metal contamination

The valve does not contain heavy metals such as Ni (nickel) or Cr (chrome) and a low sputtering yield also helps to minimize heavy metal contamination of semiconductor

Uniform baking temperature

Excellent thermal conductivity results in a uniform Temperature distribution of 120°C specifications temperature for the entire valve body and a marked decrease in the condensation of gases inside the valve.

High Vacuum Angle Valves XL□ Series Features

XLA/XLAV (Bellows seal, Single acting) Particulate-free and clean room compatible bellows

- type Pressure-balance mechanism
- XLC/XLCV (Bellows seal, Double acting) · Particulate-free and clean room compatible bellows
- type
 Pressure-balance mechanism

XLF/XLFV (O-ring seal, Single acting)

- High speed response
- Particulates are reduced through special surface treatment of shaft seal.

XLG/XLGV (O-ring seal, Double acting)

- High speed response
- · Particulates are reduced through special surface treatment of shaft seal

- XLD/XLDV (2-Step control, Single acting)
- Initial stage exhaust valve and main exhaust valve
- are combined. (flow rate 2-step control valve) . Designed with a compact system and reduced
- piping
 Prevents particulate turbulence inside the
- chamber during exhaustion.
- · Prevents pumps from running while overloaded. Initial exhaust valve flow is adjustable.

XLH (Bellows seal, Manual)

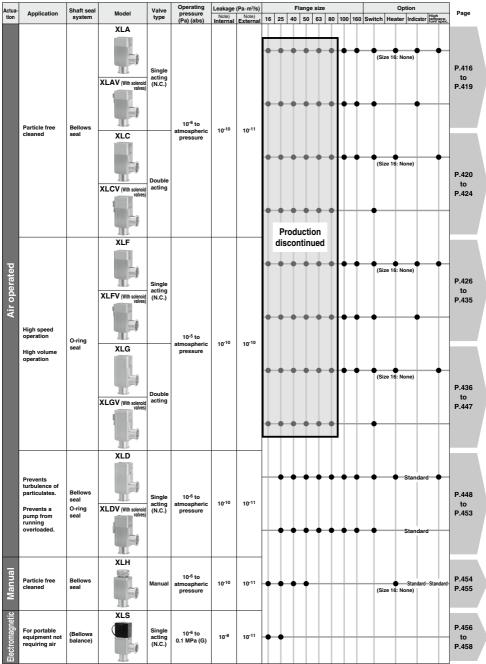

- Bellows type is particulate free and cleaned.
- Pressure balance mechanism allows unrestricted exhaust direction.
- Low actuation torque (0.5 N·m or less)
- Spring provides standard sealing load Handle height is the same when valve is open or closed
- · Indicator to confirm opening and closing of valve
- is standard equipment.

- XLS (Bellows pressure balance, Normally closed electromagnetic)
- · Particulates are reduced because there are no sliding metal parts.
- Pressure balance mechanism allows unrestricted exhaust direction.
- A control power supply circuit for solenoid valve drive has been made standard.
- . Can be used in portable equipment since air for drive is not necessary.

Series Variations

The production of flange sizes 16, 25, 40, 50, 63, and 80 for the XLA(V)/XLC(V)/XLF(V)/XLG(V) series has been discontinued. Please select the new XLII-2 type. See here for details.

High Vacuum Angle Valves

Note) In case of standard seal material (FKM)

^{*} Heater and high temperature specifications are not available with switches.

Note 1) Conductance is the value for an elbow with the same dimensions.

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Construction/Operation

<Options>

<Working principle> By applying the pilot pressure from the pilot

port, the piston-coupled valve overcomes the spring force or operating force by pressure, and the valve opens.

For the XLAV, the pilot pressure is always applied to the port 1(P), and the valve opens when the solenoid valve is turned ON and closes when it is turned OFF. Auto switch: The magnet activates the auto switch. With 2 auto switches, the open and closed positions are detected, and with 1 auto switch, either the open or closed position is

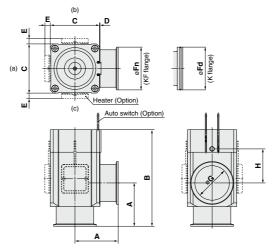

detected. Auto switches are applicable at ordinary temperatures only (5 to 60°C). Heater: Simple heating is performed using thermistors. The valve body can be heated to

approximately 100 or 120°C, depending on the heater option and the valve size. The type and number of thermistors to be used will vary depending upon size and setting temperature. In the case of high temperature specifications, the bonnet assembly is a heat resistant structure. This does not apply in cases where a solenoid valve is attached

Indicator: When the valve is open, an orange marker appears in the center of the name plate.

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Construction/Operation

With solenoid valve

Valve side exhaust * Refer to the back of page 465 for "Maintenance Parts".

<Working principle>

By applying the pilot pressure from the pilot port P-1, the piston-coupled valve overcomes the operating force by pressure, and the valve opens. (Pilot port P-2 is open.) Conversely, by applying the pilot pressure to the pilot port P-2, the valve closes. (Pilot port P-1 is open.) For the XLCV, the pilot pressure is always applied to the port 1(P), and the valve opens when the solenoid valve is turned ON and closes when it is turned OFF. For the double solenoid, the valve moves to the opposite side from that in which the solenoid valve is turned ON.

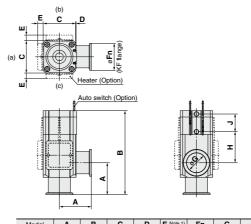

<Options>

Auto switch: The magnet activates the auto switch. With 2 auto switches, the open and closed positions are detected, and with 1 auto switch, either the open or closed position is detected. Auto switches are applicable at ordinary temperatures only (5 to 60°C).

Heater: Simple heating is performed using thermistors. The valve body can be heated to approximately 100 or 120°C, depending on the heater option and the valve size. The type and number of thermistors to be used will vary depending upon size and setting temperature. In the case of high temperature specifications, the bonnet assembly is a heat resistant structure. This does not apply in cases where a solenoid valve is attached.

Note 1) Conductance is the value for an elbow with the same dimensions.

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Note 3) A coating of vacuum grease [Y-VAC2] is applied to the seal-material sliding portion of the vacuum part.

Construction/Operation

<Options>

By applying the pilot pressure from the pilot port, the piston-coupled valve overcomes the spring force or operating force by pressure, and the valve opens. For the XLFV, the pilot pressure is always applied to the port 1(P), and the valve opens when the solenoid valve is turned

ON and closes when it is turned OFF.

<Working principle>

Auto switch: The magnet activates the auto switch. With 2 auto switches, the open and closed positions are detected, and with 1 auto switch, either the open or closed position is

* Refer to the back of page 465 for "Maintenance Parts".

detected. Auto switches are applicable at ordinary temperatures only (5 to 60°C). Heater: Simple heating is performed using thermistors. The valve body can be heated to approximately 100 or 120°C, depending on the heater option and the valve size. The type and number of thermistors to be used will vary depending upon size and setting temperature. In the case of high temperature specifications, the bonnet assembly is a heat resistant structure. This does not apply in cases where a solenoid valve is attached.

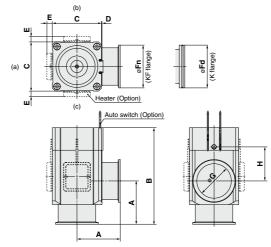

Indicator: When the valve is open, an orange marker appears in the center of the name plate.

Note 1) Conductance is the value for an elbow with the same dimensions.

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Note 3) A coating of vacuum grease [Y-VAC2] is applied to the seal-material sliding portion of the vacuum part.

Construction/Operation

Valve side exhaust * Refer to the back of page 465 for "Maintenance Parts".

<Working principle>

By applying the pilot pressure from the pilot port P-1, the piston-coupled valve overcomes the operating force by pressure, and the valve opens. (Pilot port P-2 is open.) Conversely, by applying the pilot pressure to the pilot port P-2, the valve closes. (Pilot port P-1 is open.) For the XLGV, the pilot pressure is always applied to the port 1(P), and the valve opens when the solenoid valve is turned ON and closes when it is turned OFF. For the double solenoid, the valve moves to the opposite side from that in which the solenoid valve is turned ON.

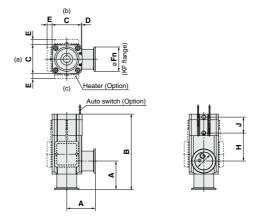

<Options>

Auto switch: The magnet activates the auto switch. With 2 auto switches, the open and closed positions are detected, and with 1 auto switch, either the open or closed position is detected. Auto switches are applicable at ordinary temperatures only (5 to 60°C).

Heater: Simple heating is performed using thermistors. The valve body can be heated to approximately 100 or 120°C, depending on the heater option and the valve size. The type and number of thermistors to be used will vary depending upon size and setting temperature. In the case of high temperature specifications, the bonnet assembly is a heat resistant structure. This does not apply in cases where a solenoid valve is attached.

Dimensions

		XLDV	0.57	1.3	1.9	3.5	5.7	11.6	20.1

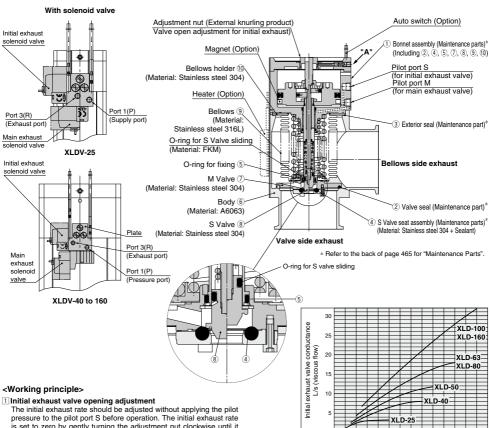

Note 1) The main exhaust valve conductance is the valve for the "molecular flow" of an elbow with the same dimensions. The initial exhaust valve conductance is the value for the "viscous flow".

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Note 3) A coating of vacuum grease [Y-VAC2] is applied to the seal-material sliding portion (initial exhaust valves sliding parts) of the vacuum part.

Aluminum High Vacuum Angle Valve XLD/XLDV Series

Construction/Operation

is set to zero by gently turning the adjustment nut clockwise until it stops. (Do not use any tools.) The initial exhaust rate is adjusted by turning the adjustment nut counterclockwise.

2 Opening of the initial exhaust valve (valve S)

When the pilot pressure is applied to the pilot port S, the valve S is removed from the valve S seal assembly, and the valve opens the adjusted amount. For the XLDV, when the pilot pressure is always applied to the port 1(P) and the initial exhaust solenoid valve is turned ON, the valve opens the adjusted amount.

3 Opening of the main exhaust valve (valve M)

When the pilot pressure is applied to the pilot port M, the valve M is removed from the body seat portion, and the valve fully opens. For the XLDV, when the pilot pressure is applied to the port 1(P) and the initial exhaust solenoid valve is turned ON, the valve fully opens.

4 Closing of the initial exhaust / main exhaust valves

By removing the pilot pressure from the pilot port S and pilot port M, both S and M valves return to their previous positions and they are sealed. For the XLDV, by turning OFF the initial exhaust valve and main exhaust valve, both S and M valves return to their previous positions and they are sealed.

<Options>

(for main exhaust valve

The magnet actuates the auto switch. With two autoswitches, the open and closed positions are detected, and with one auto switch, either the open or closed position is detected. Auto switches are applicable at ordinary temperatures only (5 to 60°C).

valve body can be heated to approximately 100 or 120°C, depending on the heater option and valve size. The type and number of thermistors to be used will vary depending upon size and setting temperature. In the case of high temperature specifications, the bonnet assembly is a heat resistant structure. This is not

Note) The adjustment nut does not rotate during valve operation. However, rotation of the adjustment nut can be fixed to prevent incorrect operation. When fixing the adjustment nut after setting, tighten it with the tightening torque shown in the table below. (Tightening with excessive torque can result in damaged components or the generation of abnormal noise.)

Note 1) The conductance is the same as that of an elbow of the same dimensions.

Note 2) For valve heater specifications, refer to "Common Option [1] Heater" on page 459.

Construction/Operation

<Working principle>

By turning the handle to the left, the valve opens. The handle does not move up and down, but the indicator shows the open or closed position of the valve. As the handle is turned to the right, the valve closes, and when the turning force of the handle suddenly ceases to be felt, the valve is sealed. The sealing force for the valve comes from the spring, and is constant.

<Options>

Heater: Simple heating is performed using thermistors. The valve body can be heated to approximately 100 or 120°C, depending on the valve size.

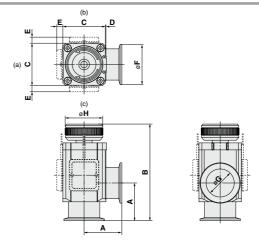

The type and number of thermistors to be used will vary

depending upon size and setting temperature.

Indicator: When the valve is open, an orange marker appears in

the center of the name plate.

Aluminum High Vacuum Angle Valve Electromagnetic/Bellows Pressure Balance

XLS Series (6

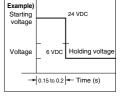

How to Order

⚠ Warning

(1) In case there is no control power supply (XLS-25-□□: 24/48/100 VDC), starting voltage should be applied for only 0.15 to 0.2 s, in accordance with the prescribed method (indicated on the back of the coil). Continuously applying starting voltage can cause overheating of the coil and fire. Holding voltage is 25% of the starting voltage (the application method is shown on the back of the solenoid coil).

Construction/Operation

<Working principle>

XLS-□-□□ (Without control power supply)

Exterior seal

By energizing the coil assembly for 0.15 to 0.2 s with the starting voltage, the valve 9 opens. After that, it is held with 25% of the starting voltage. Please do not energize with the starting voltage for 0.3 s or more, as burnout may result. When energizing of the coil assembly is canceled, the valve 9 closes.

XLS-□-P□G (With control power supply)

By applying the rated voltage to the coil assembly, the valve 9 opens. When energizing of the coil assembly is canceled, the valve 9 closes.

· Because the pressure is in balance, the direction of exhaust may be decided freely.

XL□ Series Common Option

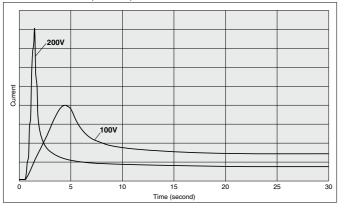

1 Heater

Valve heaters are common for models **XLA**, **XLC**, **XLD**, **XLF**, **XLG** and **XLH**. Power consumption specifications are shown in the below table.

Item			XL□-25	XL□-40	XL□-50	XL□-63	XL□-80	XL□-100	XL□-160	
Rated heater voltage			90 to 240 VAC							
	Heater assembly quantity		_	1 pc.	1 pc.	1 pc.	1 pc.	2 pcs.	3 pcs.	
Heater assembly quantity used	H4	100V	_	200/40	200/50	400/100	600/150	800/220	1200/350	
Heater power W (Nominal value)	100°C	200V	_	800/40	800/50	1600/100	2400/150	3200/220	4800/350	
In-rush/Power consumption	Heater assembly quantity		1 pc.	1 pc.	1 pc.	1 pc.	2 pcs.	3 pcs.	4 pcs.	
(Option symbol-Operating voltage)	H5	100V	200/40	400/70	400/80	600/130	800/180	1200/300	1600/400	
	120°C	200V	800/40	1600/80	1600/80	2400/130	3200/180	4800/300	6400/400	

^{*} The inrush current of the heater flows for several ten seconds when using 100V while it flows for several seconds when using 200V. However, this inrush current

Inrush current flow time (Reference)

XLA
XL

XL

Q

XM

XY

D-

XVD

XSA

decreases momentarily.

* When the valve uses multiple heater assemblies, do not turn ON the power to each heater assembly at the same time. Turn ON the power to each heater assembly one-by-one in order at intervals of 30 sec. since the inrush current is large.

^{*} The heater temperature will decrease several % from the start of heating and then becomes stable. (The heater temperature may decrease approximately 5 to 10% due to individual differences.)

^{*} Refer to "Maintenance Parts" on page 465 for further details regarding quantity and type.

XL□ Series Glossary

1 Seal Materials

Please note that the following are general features and subject to change depending on processing conditions. For details, please contact sealing component manufacturerers.

FKM (Fluororubber)

With low outgassing, low permanent-setting and low gas permeation rates, this is the most popular seal material for high vacuums. Standard material used by SMC's high vacuum angle valve is Mitsubishi Cable Industries, Ltd. (Compound No. 1349-80).

It is advisable to choose a model depending on its application, because an improved material compound (3310-75) which reduces the weight reduction ratio with O_2 plasma is also available.

Kalrez® + Kalrez® is a registered trademark of E.I. du Pont de Nemours and Company or its affiliates. This material, perfluoroelastomer (FFKM), has excellent heat and chemical resistance, but its permanent-setting is large, and special caution is required. Variations are available with improved plasma (O2, CF4) and particulate resistance; therefore it is advisable to select types based upon the application.

Compound No. 4079: Standard Kalrez®, excellent in gas and heat resistance.

Chemraz® * Chemraz® is a registered trademark of Greene, Tweed Technologies, Inc.
This material, perfluoroelastomer (FFKM), has excellent chemical and plasma resistance and has slightly higher heat resistance than FKM. Several variations of Chemraz® are available and it is advisable to choose based upon the particular plasma being used and other conditions, etc.

Compound No. SS592: Excellent physical properties and especially effective for moving parts.

Compound No. SS630: Applicable to both fixed and moving parts and compatible with a wide variety of applications.

Compound No. SSE38: The cleanest material among Chemraz®, developed for high-density plasma instruments

Barrel Perfluoro® • Barrel Perfluoro® is a registered trademark of Matsumura Oil Co.,Ltd.
Compound No. 70W: Perfluoroelastomer (FFKM) which does not contain a metal filler. Resistant against NF3, NH3. Low particle generation under dry process conditions.

ULTIC ARMOR® • ULTIC ARMOR® is a registered trademark of Nippon Valqua Industries, Ltd. Fluoro-based rubber which does not contain a metal filler. Seal material which is plasma-resistant and has low gas emittance and heat resistance.

Silicone (Silicone rubber, VMQ)

This material is relatively inexpensive, has good plasma resistance, but its gas permeation rate is high.

Optional seal material used by SMC's high vacuum angle valve is Mitsubishi Cable Industries, Ltd. (Compound No. 1232-70, White)

It has a low weight-reduction ratio and low particle generation within O_2 plasma and NH_3 gas environments.

EPDM (Ethylenepropylene rubber)

Relatively lower priced and excellent in weatherability, chemical and heat resistance, but with no resistance at all to general mineral oil. Optional seal material used by SMC's high vacuum angle valve is Mitsubishi Cable Industries, Ltd. (Compound No. 2101-80)

Resistant to NH3 gas, etc.

2 Shaft Sealing Method

Rellows

Bellows offer cleaner sealing with reduced particle generation and less outgassing. The two major bellow types are: Formed-bellows and Welded-bellows. Formed-bellows produce less dusts and offer higher dust resistance. Welded-bellows allow longer strokes, but generate more dust particles and offer less dust resistance. Please note, the endurance depends on length and speed of the strokes.

O-ring, etc.

Due to entrainment of gases and generation of particulates, vacuum performance is somewhat inferior to the bellows type. However, high speed operation is possible and durability is comparatively high. In general, fluorinated grease is affixed to the shaft seal portion.

3 Response Time/Operation Time

Valve opening

The time from the application of voltage to the actuation solenoid valve (XL \square) until 90% of the valve stroke has been completed is the valve opening response time. Valve opening operation time indicates the time from the start of the stroke until 90% of movement has been completed. Both of these become faster as the operating pressure is increased.

Valve closing

The time from the cut off of power to the actuation solenoid valve ($XL\square$) until 90% of the valve return stroke has been completed is the valve closing response time. Valve closing operation time indicates the time from valve opening until 90% of return movement has been completed. Both of these become slower as the operating pressure is increased.

4 Molecular Flow Conductance

Orifice conductance

In the case of a ØA (cm²) hole in an ultra-thin plate, conductance "C" results from "V", the average velocity of the gas; "F", the gas constant; "M", the molecular weight; and "T", the absolute temperature. From the formula C=11.6A (L/sec) at an air tempearture of 20°C.

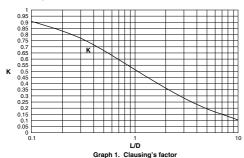

Cylinder conductance

With length "L" (cm) and diameter "D" (cm) where L>>D, from the formula C= $(2\pi RT/M)^{0.5}D^3/6L$, the conductance C=12.1 D³/L (L/sec) at an air temperature of 20°C.

Short pipe conductance

From the Clausing's factor "K" and hole conductance "C" in Graph 1. (Clausing's factor drawing), the short pipe conductance C_K is easily found as C_K =KC.

Conductances combined

When each of the separate conductances are given as C_1 , C_2 and C_1 , the composite conductance ΣC is expressed as: $\Sigma C=1/(1/C_1+1/C_2+\cdots+1/C_1)$ when in series, and $\Sigma C=C_1+(C_2+\cdots+C_1)$, when in parallel.

5 He Leakage

Surface leakage

This leakage occurs between surfaces of the sealing and the seal material. In the case of elastic body seal (elastomer), leakage values are confirmed within minutes of operation. Leakage rate is measured at room temperature (20 to 30°C).

Gas permeation

This is leakage caused by diffusion through the elastic body seal material. As temperature increases, the diffusion rate increases, and in many cases, becomes greater than surface leakage. The diffusion rate is proportional to the cross-sectional area (cm²) of the seal, and inversely proportional to the seal width (distance between the atmosphere and the vacuum side). In the case of metal gaskets, only hydrogen diffusion should be considered.

6 Outgassing

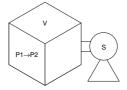

This is a phenomenon where gases adhered or adsorbed to the metallic surface or its inside parts are released from the surface and drawn into the vacuum according to the pressure decrease. The smoothness of the surface and closeness of the oxidized layer can effect (increase/decrease) this.

7 Ultimate Pressure

Ultimate pressure P (Pa) is P=Q/S, where the sum of Weight flow rates for outgassing (Qg) and leakage Q(L) is Q(Pa·m³/s), and the exhaust speed is $S(m^3/s)$. The ultimate pressure is measured with Qg, Q(L)S shown as above, and the ultimate pressure of the pump itself. In the case of very low pressure, the exhaust characteristics of the actual pump can be the limiting factor. In particular, a deterioration of exhaust characteristics due to an unclean pump and invasion of the atmospheric moisture can be the major factor.

8 Exhaust Time (Low/Medium Vacuum)

The time (\triangle t) required to exhaust a chamber at low vacuum with volume V (L), from pressure P1 to P2, using a pump with pumping speed S (L/sec) is \triangle t=2.3(V/S)log(P1/P2). In high vacuum, this is subject to the ultimate pressure limit imposed by outgasing and leakage as characterized above.

9 Baking

Gases such as oxygen and nitrogen, which have a small adsorption activation energy (E) and a short adsorption residence time (r), are evacuated quickly. However, in the case of water, which has a high activation energy, evacuation does not progress quickly unless the temperature (T: absolute temperature) is raised to shorten residence time. This time is characterized as $\tau=0$ exp(E/RT) where R is the ideal gas constant and $\tau0=(approx.)$ 10^{-13} sec.

Residence time of water at 20°C is 5.5 x 10°6 sec, whereas at 150°C, it is 2.8 x 10°8 sec, or about 200 times shorter. The objective of baking is to exhaust water with long adsorption residence time more quickly.

Air Operated Angle Valves/XLA(V), XLC(V), XLD(V), XLF(V), XLG(V) Series

Design

⚠ Warning

All models

- 1. The body material is A6063, the bellows are stainless steel 316L, and other metal seal material is stainless steel 304. Standard seal material in the vacuum section is FKM that can be changed to the other materials (please refer to "How to Order"). Use fluids which are compatible with materials after confirming.
- Select materials for the actuation pressure piping, and heat resistance for fittings that are suitable for the applicable operating temperatures.
- Model with auto switch/XLA(V), XLC(V), XLD(V), XLF(V), XLG(V)
- The switch section should be kept at a temperature no greater than 60°C.

Model with heater/XLA, XLC, XLD, XLF, XLG

- When using a model with a heater (thermistor), a device should be installed to prevent overheating.
- Model with solenoid valve/XLAV, XLCV, XLDV, XLFV. XLGV
- For models with a solenoid valve, the temperature of the solenoid valve section should be no greater than 50°C.

Selection

All models

- For high vacuum valves used in the main exhaust lines of flat panel display manufacturing equipment and other large manufacturing equipment, the XLF(V) or XLG(V) series, employing O-ring seal type for improved durability, is recommended.
- When controlling valve responsiveness, take note of the size and length of piping, as well as the flow rate characteristics of the actuating solenoid valve.
- Actuating pressure should be kept within the specified range. 0.4 to 0.5 MPa is recommended.
- 4. Use within the limits of the operating pressure range.
- The actuating piston chamber and the bellows chamber [except for XLF(V)/XLG(V)] are directly connected to atmosphere.

Please use in an environment in which dust emissions will not cause problems. (Please consult SMC if the release of dust must be avoided.)

High temperature type/XLA, XLC, XLD, XLF, XLG

 In the case of gases which cause a large amount of deposits, heat the valve body to prevent deposits in the valve.

Mounting

↑ Caution

All models

- 1. In high humidity environments, keep valves packaged until the time of installation.
- 2. In case with switches and solenoid valves, secure the lead wires so that they have sufficient slack, without any unreasonable force applied to them.
- Perform piping so that excessive force is not applied to the flange sections. In case there is vibration of heavy objects or attachments, etc., secure them so that torque is not applied directly to the flanges.

Mounting

⚠ Caution

- 4. Vibration resistance allows for normal operation up to 30 m/s² (45 to 250 Hz), but continuous vibration may cause a decline in durability. Arrange piping to avoid excessive vibrations or shocks.
- High temperature type (Model/XLA, XLC, XLD, XLF, XLG; Temperature specifications/H0, H2, H3)
- In models with heater (thermistor), take care not to damage the insulation components of the lead wires and connector section.
- 2. The setting temperature for models with heater should be established without a draft or heat insulation. It will change depending on conditions such as heat retaining measures and the heating of other piping. Fine adjustment is not possible.
- When installing heater accessories or mounting a heater, check insulation resistance at the actual operating temperature. A short circuit breaker or fuse should be installed.
- When a valve is to be heated, only the body section should be heated, excluding the bonnet section.
- When a heater is in operation, the entire valve becomes hot. Be careful not to touch it with bare hands, as burns will result.

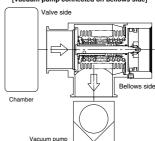

Piping

- Before mounting, clean the surface of the flange seal and the O-ring with ethanol, etc.
- 2. There is an indentation of 0.1 to 0.2 mm in order to protect the flange seal surface, and it should be handled so that the seal surface is not damaged in any way. When using an outer ring, be sure that the O-ring is compressed sufficiently. (There is basically no problem with the outer ring.)
- 3. Exhaust direction
 - During operation, the direction of the exhaust may be determined freely, but in cases where a flow is generated by the exhaust, a decline in durability may result.

The exhaust direction shown in the figure below (bellows side exhaust) is recommended.

Please take all available precautions, as the life of the equipment is affected by conditions of usage.

Recommended exhaust direction [Vacuum pump connected on bellows side]

4. The valve may not be mounted depending on the piping material type (clamp, etc.). Be sure to check the piping material before use.

Be sure to read this before handling the products.

Air Operated Angle Valves/XLA(V), XLC(V), XLD(V), XLF(V), XLG(V) Series

Maintenance

- When removing deposits from a valve, take care not to damage any of its parts.
- Replace the bonnet assembly when the end of its service life is approached.
- If damage is suspected prior to the end of the service life, perform early maintenance.

Maintenance

- 4. SMC specified parts should be used for service. Refer to "Construction", "Replacement Parts," or "Maintenance Parts."
- When removing valve or exterior seals, take care not to damage the sealing surfaces. When installing the valve seal, be sure that the O-ring is not twisted.

Manual Angle Valve/XLH Series

Design

⚠ Warning

interfere with the material

- 1. The body material is A6063, the bellows are stainless steel 316L, other vacuum parts are stainless steel 304. FKM is the standard seal material for the vacuum part, but other materials may be selected (please refer to How to Order). Please check the material used, and use only fluids that will not
- When using a model with a heater (thermistor), a device should be installed to prevent over heating.

Selection

- 1. Use within the limits of the operating pressure range.
- In the case of gases which cause a large amount of deposits, heat the valve body or use a model with heater to prevent deposits in the valve.

Mounting

- In models with heater (thermistor), take care not to damage the insulation components of the lead wires and connector section.
- The setting temperature for models with heater should be established without a draft or heat insulation. It will change depending on conditions such as heat retaining measures and the heating of other piping. Fine adjustment is not possible.
- When installing heater accessories or mounting a heater, check insulation resistance at the actual operating temperature. A short circuit breaker or fuse should be installed.
- When a valve is to be heated, only the body section (excluding handle part) should be heated.
- In high humidity environments, keep valves packaged until the time of installation.
- 6. When a heater is in operation, the entire valve becomes hot. Be careful not to touch it with bare hands, as burns will result.
- 7. Perform piping so that excessive force is not applied to the flange sections. In case there is vibration of heavy objects or attachments, etc., secure them so that torque is not applied directly to the flanges.

Piping

⚠ Caution

- Before mounting, clean the surface of the flange seal and the O-ring with ethanol, etc.
- 2. There is an indentation of 0.1 to 0.2 mm in order to protect the flange seal surface, and it should be handled so that the seal surface is not damaged in any way. When using an outer ring, be sure that the O-ring is compressed sufficiently. (There is basically no problem with the outer ring.)
- The valve may not be mounted depending on the piping material type (clamp, etc.). Be sure to check the piping material before use.

Maintenance

∕ Caution

- When removing deposits from a valve, take care not to damage any of its parts.
- Replace the handle assembly when the end of its service life is approached.
- If damage is suspected prior to the end of the service life, perform early maintenance.
- 4. SMC specified parts should be used for service. Refer to "Construction", "Replacement Parts," or "Maintenance Parts."
- When removing valve or exterior seals, take care not to damage the sealing surfaces. When installing the valve seal, be sure that the O-ring is not twisted.

Angle Solenoid Valve/XLS Series

Design

\land Warning

- 1. The body material is A6063, the bellows are stainless steel 316L, the other metal materials used in the vacuum part are 13Cr stainless steel, stainless steel 304, and A2017, and the seal material is FKM. In addition, a fluorinated resin (PFA) is used in the armature assembly of the vacuum part. The valve of the vacuum part has a fluorinated grease coating. Please check the material used, and in the course of maintenance, use only liquids that will not interfere with the material.
- 2. In cases without an operating power supply, the starting voltage is applied for only 0.15 to 0.2 s, and after this, a holding voltage (25% of the starting voltage) must be applied. If not performed properly, this can cause burning of the coil and fire, etc.
- Be certain to install a fuse or short circuit breaker in the power supply circuit.

Selection

∧ Caution

1. Use within the limits of the operating pressure range.

Mounting

⚠ Caution

- In high humidity environments, keep valves packaged until the time of installation.
- 2. Please secure in such a way that the lead wire has sufficient curvature, and that no excessive force is applied to it.

Changing the entry of DIN terminal connector

After separating the terminal block and housing, the cord entry can be changed by attaching the housing in the desired direction (4 directions at 90° intervals).

Piping

- Before mounting, clean the surface of the flange seal and the O-ring with ethanol, etc.
- 2. There is an indentation of 0.1 to 0.2 mm in order to protect the flange seal surface, and it should be handled so that the seal surface is not damaged in any way. When using an outer ring, be sure that the O-ring is compressed sufficiently. (There is basically no problem with the outer ring.)
- The valve may not be mounted depending on the piping material type (clamp, etc.). Be sure to check the piping material before use.

Maintenance

∧ Caution

- Replace the core and armature assemblies when the end of their service life is approached.
- If damage is suspected prior to the end of the service life, perform early maintenance.
- **3.** SMC specified parts should be used for service parts. Refer to "Replacement Parts" on back of page 465 for further details.

Be sure to read this before handling the products.

Maintenance Parts

Air operated angle valve/Manual valve

1. When replacing seal materials, please replace bonnet assembly or handle assembly. This may not be applicable in cases where the seal material differs from that used in the products.

Note 3) In cases where the seal material is other than the standard (FKM: includes Compound no. 1349-80: made by Mitsubishi Cable Industries, Inc.), please add suffix symbol for seal material (shown in the below table) at the end of the part number (the place of □).

Note 4) Refer to "Construction" of each series for component parts numbers.

Table 1: Seal Material Symbol

Symbol	-XN1	-XP1	-XQ1	-XR1	-XR2	-XR3	-XS1	-XT1	-XU1
Seal material	EPDM	Barrel Perfluoro®	Kalrez [®]		Chemraz [®]		VMQ	FKM for Plasma	ULTIC ARMOR®
Compound no.	2101-80*	70W	4079	SS592	SS630	SSE38	1232-70*	3310-75*	UA4640
Note 5) This may not be applicable in cases where the seal material differs from that used in the products, although the seal material is changed. * Produced by Mitsubishi Cable Industries. Ltd.									

Barrel Perfluoro® is a registered trademark of Matsumura Oil Co., Ltd. Kalrez[®] is a registered trademark of E. I. du Pont de Nemours and Company or its affiliates.

Chemraze is a registered trademark of Greene, Tweed Technologies, Inc. ULTIC ARMOR® is a registered trademark of Nippon Valqua Industries, Ltd.

Replacement Heaters

Temperature	Valve size									
specification	25	40	50	63	80	100	160			
H4 (100°C heater)	_	XLA25-60S-1	XLA25-60S-1	XLA25-60S-2	XLA25-60S-3	XLA25-60S-2 (2 sets)	XLA25-60S-2 (3 sets)			
H5 (120°C heater)	XLA25-60S-1	XLA25-60S-2	XLA25-60S-2	XLA25-60S-3	XLA25-60S-2 (2 sets)	XLA25-60S-2 (3 sets)	XLA25-60S-2 (4 sets)			
Example) In the case of a replacement heater for XL□-80-H5, two sets of XLA25-80M-2 are required.										

Angle Solenoid Valve

Angle Sole	noid vaive					
Construction No.	Description	XLS-16-□□	XLS-16-P□□	XLS-25-□□	XLS-25-P□□	No
2	Coil assembly	XLS16-20-⊞G, C, T, D	XLS16-20-P⊞G	XLS25-20-⊞G, C, T, D	XLS25-20-P®G

Note 1 in cases where the valve seal material is other than the standard (FKM: includes Compound no. 1349-90: made by Mitsubishi Cable Industries, Inc.), please add suffix symbol for seal material (shown in the below table) at the end of the part number.

Note 2) An auto switch magnet is not attached. In cases where an auto switch magnet is attached, please add "-M9/" (M9// for the XLC/XLG with a size of 50 or more) at the end of the part number. (Not available for high temperature models)

Note 3) Auto switch and soletened valve are not attached. When a set including auto switch and solenoid valve are not attached. When a set including auto switch and solenoid valve is required, please add the symbols after the auto switch in "How to Order" at the end of the part number.
