

**Product Note, PN 411, Revision 1
AP 3651 and AP 4651 Diaphragm Valve**

August 5, 2013

The AP 3651 and AP 4651 series provide extra knob friction for lower pressure applications of the AP 3650 and AP 4650 valves. A non-wetted O-ring is added between the knob and the indication plate below it. This increases the friction on the knob and torque required to turn it. The increased friction reduces the possibility of accidentally bumping the knob open from the closed position or closing the valve from the open position. This is not generally a desirable option for higher pressure applications where the system pressure itself provides the resistance against the knob.

The O-ring is the only modification to the valve. There are no changes in specifications nor dimensions with this option.

Please consult the factory or your local distributor should additional information or assistance be desired.
