Direct Operated 2 Port Solenoid Valve

For Water, Oil, Steam, Air

New Seriles now on sale!

Solenoid valves for various fluids used in a wide variety of

Improvement of corrosion resistance

Special magnetic material adopted

Enclosure: Equivalent to IP65

Flame resistance UL94V-0 conformed

Flame resistant mold coil material

Low noise construction

Special construction enables to reduce the metal noise. (DC specification)

Improvement of (maintenance performance

Maintenance is performed easily due to the threaded assembly.

Reduction of power consumption (DC specification)

VX21: $6 \text{ W} \rightarrow 4.5 \text{ W}$

 $VX22: 8 \text{ W} \rightarrow 7 \text{ W}$

 $VX23: 11.5 \text{ W} \rightarrow 10.5 \text{ W}$

Low power consumption type: **0.8** W (Held at 24 VDC)

> With mounting threads on the bottom

A dedicated bracket is available.

Solenoid Valves Flow Characteristics

(How to indicate flow characteristics)

1. Indication of flow characteristics

Indication of the flow characteristics in specifications for equipment such as solenoid valve, etc. is depending on "Table (1)".

Table (1) Indication of Flow Characteristics

Corresponding equipment	Indication by international standard	Other indications	Standards conforming to
Equipment for	C, b	_	ISO 6358: 1989 JIS B 8390: 2000
pneumatics			JIS B 8390: 2000 Equipment: JIS B 8373, 8374, 8375, 8379, 8381
		Cv	ANSI/(NFPA)T3.21.3: 1990
Equipment for controlling	Av	_	IEC60534-2-3: 1997 JIS B 2005: 1995
process fluids	_	Cv	Equipment: JIS B 8471, 8472, 8473

2. Equipment for pneumatics

2.1 Indication according to the international standards

(1) Standards conforming to

ISO 6358: 1989 : Pneumatic fluid power—Components using compressible fluids—

Determination of flow-rate characteristics

JIS B 8390: 2000: Pneumatic fluid power—Components using compressible fluids—

How to test flow-rate characteristics

(2) Definition of flow characteristics

Flow rate characteristics are indicated as a result of a comparison between sonic conductance *C* and critical pressure ratio *b*.

Sonic conductance C: Values which divide the passing mass flow rate of an equipment in a choked flow condition by the

product of the upstream absolute pressure and the density in the standard condition.

Critical pressure ratio b: It is the pressure ratio which will turn to the choke flow (downstream pressure/upstream pressure)

when it is smaller than this values. (critical pressure ratio)

Choked flow : It is the flow in which the upstream pressure is higher than the downstream pressure and where

sonic speed in a certain part of an equipment is reached.

Gaseous mass flow rate is in proportion to the upstream pressure and not dependent on the

downstream pressure. (choked flow)

Subsonic flow : Flow greater than the critical pressure ratio

Standard condition : Air in a temperature state of 20°C, absolute pressure 0.1 MPa (= 100 kPa = 1 bar), relative humidity

65%.

It is stipulated by adding the abbreviation (ANR) after the unit depicting air volume.

(standard reference atmosphere)

Standard conforming to: ISO 8778: 1990 Pneumatic fluid power—Standard reference atmosphere, JIS B 8393: 2000: Pneumatic fluid power—Standard reference atmosphere

(3) Formula of flow rate

It can be indicated by the practical unit as following.

When

$$\frac{P_{2} + 0.1}{P_{1} + 0.1} \le b$$
, choked flow

$$Q = 600 \times C (P1 + 0.1) \sqrt{\frac{293}{273 + t}}$$
 (1)

When

$$\frac{P2 + 0.1}{P1 + 0.1} > b$$
, subsonic flow

$$Q = 600 \times C (P_1 + 0.1) \sqrt{1 - \left[\frac{P_2 + 0.1}{P_1 + 0.1} - b \right]^2} \sqrt{\frac{293}{273 + t}}$$
 (2)

Q: Air flow rate [dm³/min (ANR)], dm³ (Cubic decimeter) of SI unit are also allowed to described by ℓ (liter). 1 dm³ = 1 ℓ .

C : Sonic conductance [dm³/(s·bar)]

: Critical pressure ratio [—]

P1: Upstream pressure [MPa]

P2: Downstream pressure [MPa]

t : Temperature [°C]

Note) Formula of subsonic flow is the elliptic analogous curve.

Flow characteristics curve is indicated in the Graph (1) For details, please use SMC's "Energy Saving Program".

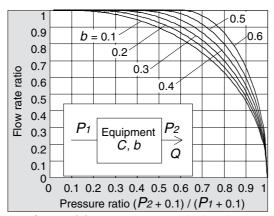

Example)

Obtain the air flow rate for $P_1 = 0.4$ [MPa], $P_2 = 0.3$ [MPa], t = 20 [°C] when a solenoid valve is performed in $C = 2 [dm^3/(s \cdot bar)]$ and b = 0.3.

According to formula 1, the maximum flow rate = $600 \times 2 \times (0.4 + 0.1) \times \sqrt{\frac{293}{273 + 20}} = 600 \text{ [dm}^3/\text{min (ANR)]}$

Pressure ratio =
$$\frac{0.3 + 0.1}{0.4 + 0.1} = 0.8$$

Based on the Graph (1), it is going to be 0.7 if it is read by the pressure ratio as 0.8 and the flow ratio to be b = 0.3. Hence, flow rate = Max. flow x flow ratio = 600 x 0.7 = 420 [dm³/min (ANR)]

Graph (1) Flow characteristics line

(4) Test method

By attaching a test equipment with the test circuit indicated in Fig. (1) while maintaining to a certain amount which does not let the upstream pressure go down below 0.3 MPa, measure the maximum flow to be saturated in the first place. Next, measure this flow rate at 80%, 60%, 40%, 20% and the upstream and downstream pressure. And then, obtain the sonic conductance Cfrom this maximum flow rate. Besides that, substitute each data of others for the formula of subsonic flow in order to find b, then obtain the critical pressure ratio b from that average.

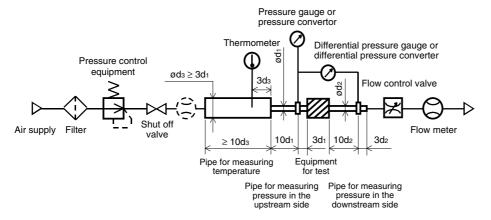

Fig. (1) Test circuit based on ISO 6358, JIS B 8390

Solenoid Valves Flow Characteristics

(How to indicate flow characteristics)

2.2 Effective area S

(1) Standards conforming to

JIS B 8390: 2000: Pneumatic fluid power—Components using compressible fluids—

Determination of flow rate characteristics

Equipment standards: JIS B 8373: 2 port solenoid valve for pneumatics

JIS B 8374: 3 port solenoid valve for pneumatics

JIS B 8375: 4 port, 5 port solenoid valve for pneumatics

JIS B 8379: Silencer for pneumatics

JIS B 8381: Fittings of flexible joint for pneumatics

(2) Definition of flow characteristics

Effective area S: is the cross-sectional area having an ideal throttle without friction deduced from the calculation of the pressure changes inside an air tank or without reduced flow when discharging the compressed air in a choked flow, from an equipment attached to the air tank. This is the same concept representing the "easy to run through" as sonic conductance C (effective area).

(3) Formula of flow rate

When

 $\frac{P_{2} + 0.1}{P_{1} + 0.1} \le 0.5$, choked flow

$$Q = 120 \times S (Pt + 0.1) \sqrt{\frac{293}{273 + t}}$$
 (3)

When

 $\frac{P2 + 0.1}{P1 + 0.1} > 0.5$, subsonic flow

$$Q = 240 \times S \sqrt{(P_2 + 0.1)(P_1 - P_2)} \sqrt{\frac{293}{273 + t}}$$
(4)

Conversion with sonic conductance C:

 $S = 5.0 \text{ x } C \dots (5)$

Q: Air flow rate[dm³/min(ANR)], dm³ (cubic decimeter) of SI unit is good to be described by ℓ (liter), too. 1 dm³ = 1 ℓ

S: Effective area [mm²]

P1: Upstream pressure [MPa]

P2: Downstream pressure [MPa]

t : Temperature [°C]

Note) Formula for subsonic flow (4) is only applicable when the critical pressure ratio b is the unknown equipment. In the formula by sonic conductance C (2), it is the same formula when b = 0.5.

(4) Test method

By attaching the equipment for testing with the test circuit shown in Fig. (2), discharge air into the atmosphere until the pressure inside the air tank goes down to 0.25 MPa (0.2 MPa) from an air tank filled with compressed air of a certain pressure (0.5 MPa) which does not go down below 0.6 MPa. At this time, measure the discharging time and the residual pressure inside the air tank which had been left until it turned to be the normal values, and then determine the effective area S by using the following formula. The volume of air tank should be selected within the specified range by corresponding to the effective area of the equipment being tested. In the case of JIS B 8373, 8374, 8375, 8379, 8381, the pressure values are in parentheses and the coefficient of formula is 12.9.

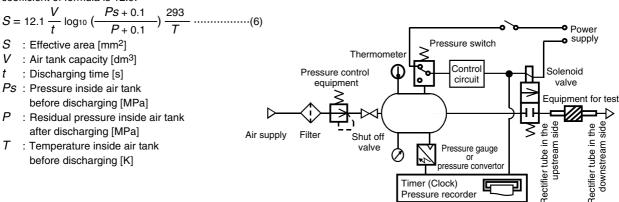

Fig. (2) Test circuit based on JIS B 8390

2.3 Flow coefficient Cy factor

The United States Standard ANSI/(NFPA)T3.21.3:1990: Pneumatic fluid power—Flow rating test procedure and reporting method for fixed orifice components

defines the Cv factor of flow coefficient by the following formula which is based on the test conducted by the test circuit analogous to ISO 6358.

$$Cv = \frac{Q}{114.5 \sqrt{\frac{\Delta P (P2 + Pa)}{T1}}}$$
 (7)

 ΔP : Pressure drop between the static pressure tapping ports [bar]

P1 : Pressure of the upstream tapping port [bar gauge]

 P_2 : Pressure of the downstream tapping port [bar gauge]: $P_2 = P_1 - \Delta P$

Q : Flow rate [dm³/s standard condition]Pa : Atmospheric pressure [bar absolute]

T1: Test conditions of the upstream absolute temperature [K]

is $< P1 + Pa = 6.5 \pm 0.2$ bar absolute, $T1 = 297 \pm 5$ K, 0.07 bar $\le \Delta P \le 0.14$ bar.

This is the same concept as effective area A which ISO6358 stipulates as being applicable only when the pressure drop is smaller than the upstream pressure and the compression of air does not become a problem.

3. Equipment for process fluids

(1) Standards conforming to

IEC60534-2-3: 1997: Industrial process control valves. Part 2: Flow capacity, Section Three-Test procedures

JIS B 2005: 1995: Test method for the flow coefficient of a valve

Equipment standards: JIS B 8471: Regulator for water

JIS B 8472: Solenoid valve for steam JIS B 8473: Solenoid valve for fuel oil

(2) Definition of flow characteristics

Av factor: Value of the clean water flow rate represented by m³/s which runs through a valve (equipment for test) when the pressure difference is 1 Pa. It is calculated using the following formula.

$$Av = Q^{\hat{\gamma}} \frac{\rho}{\sqrt{P}}$$
 (8)

Av : Flow coefficient [m²] Q : Flow rate [m³/s]

 ΔP : Pressure difference [Pa] ρ : Density of fluid [kg/m³]

(3) Formula of flow rate

It is described by the known unit. Also, the flow characteristics line shown in the Graph (2).

In the case of liquid:

$$Q = 1.9 \times 10^6 Av^{\sqrt{\frac{\Delta P}{G}}}$$
 (9)

Q: Flow rate [ℓ /min]

Av: Flow coefficient [m2]

 ΔP : Pressure difference [MPa]

G: Relative density [water = 1]

In the case of saturated aqueous vapor:

$$Q = 8.3 \times 10^6 Av^{10} \Delta P(P_2 + 0.1)$$
(10)

Q: Flow rate [m³/s]

Av : Flow coefficient [m²]

 ΔP : Pressure difference [Pa]

 P_1 : Relative density [MPa]: $\Delta P = P_1 - P_2$

P2 : Relative density [MPa]

Solenoid Valves Flow Characteristics

(How to indicate flow characteristics)

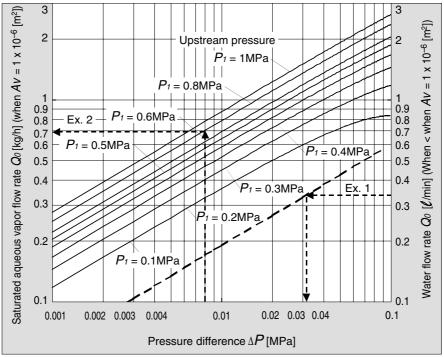

Conversion of flow coefficient:

 $Av = 28 \times 10^{-6} Kv = 24 \times 10^{-6} Cv$ (11)

Kv factor: Value of the clean water flow rate represented by the m³/h which runs through the valve at 5 to 40°C, when the pressure difference is 1 bar.

Cv factor (Reference values): It is the figures representing the flow rate of clean water by US gal/min which runs through the valve at 60° F, when the pressure difference is 1 lbf/in² (psi).

Values of pneumatic Kv are different from Cv because the testing method is different from each other.

Graph (2) Flow characteristics line

Example 1)

Obtain the pressure difference when water 15 [ℓ /min] runs through the solenoid valve with an $Av = 45 \times 10^{-6}$ [m²]. Since $Q_0 = 15/45 = 0.33$ [/min], according to the Graph (2), if reading ΔP when Q_0 is 0.33, it will be 0.031 [MPa].

Example 2)

Obtain the flow rate of saturated aqueous vapor when $P_1 = 0.8$ [MPa], $\Delta P = 0.008$ [MPa] with a solenoid valve with an Av = 1.5 x 10^{-6} [m²].

According to the Graph (2), if reading Qo when Pt is 0.8 and ΔP is 0.008, it is 0.7 [kg/h]. Hence, the flow rate $Q = 0.7 \times 1.5 = 1.05$ [kg/h].

(4) Test method

By attaching the equipment for testing with the test circuit shown in Fig. (3) and running water at 5 to 40°C, measure the flow rate with a pressure difference of 0.075 MPa. However, the pressure difference needs to be set with a large enough difference so that the Reynolds number does not go below a range of 4 x 10⁴.

By substituting the measurement results for formula (8) to figure out Av.

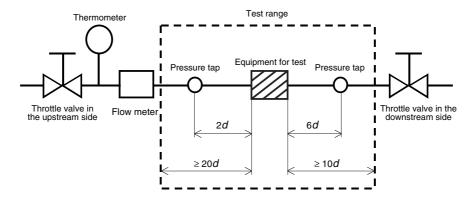

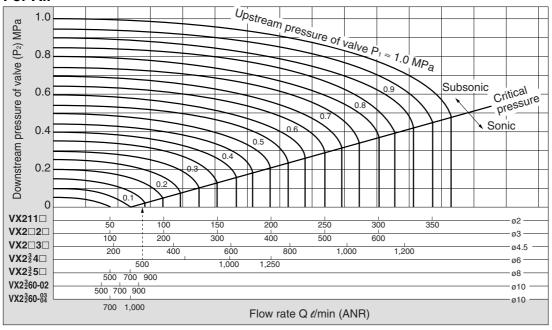

Fig. (3) Test circuit based on IEC60534-2-3, JIS B 2005

Flow Characteristics

Note) Use this graph as a guide. In the case of obtaining an accurate flow rate, refer to front matter pages 1 to 6.

For Air

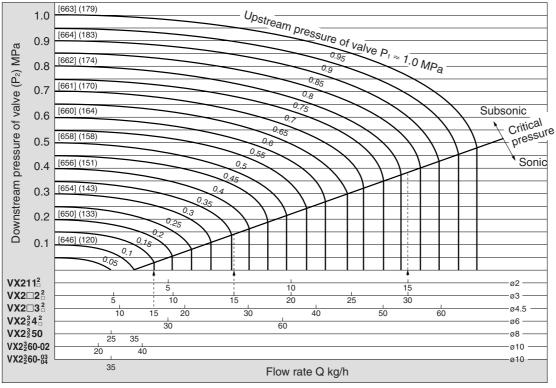

How to read the graph

The sonic range pressure to generate a flow rate of 500 t/min (ANR) is

 $P_1 \approx 0.14$ MPa for a Ø6 orifice (VX2 $\frac{3}{2}$ 4 \square), and

 $P_{1}\approx 0.3$ MPa for a ø4.5 orifice (VX2 $\square 3\square).$

For Saturated Steam

Figures inside [] indicate the saturated steam holding heat (kcal/kg). Figures inside () indicate the saturation temperature (°C).

How to read the graph

The sonic range pressure to generate a flow rate of 15 kg/h is

 $P_1\approx 0.15$ MPa for ø4.5 orifice (VX2 $\square 3\square S),~P1\approx 0.37$ MPa for ø3 orifice (VX2 $\square 2\square S),$ and

P₁ ≈ 0.82 MPa for ø2 orifice (VX211□S). The holding heat differs somewhat depending on the pressure P₁, but at 15 kg/h it is approximately 9700 kcal/h.

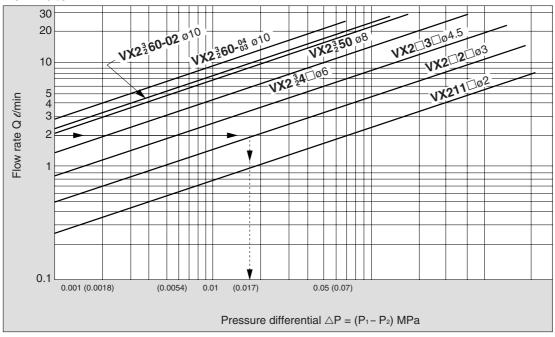

Flow Characteristics

Note) Use this graph as a guide. In the case of obtaining an accurate flow rate, refer to front matter pages 1 to 6.

For Water

How to read the graph

When a water flow of 2 d/min is generated, △IP ≈ 0.017 MPa for a valve with ø3 orifice (VX212□, 222□, 232□).

Glossary of Terms

Pressure Terminology

1. Maximum operating pressure differential

The maximum pressure differential (the difference between the inlet and outlet pressure) which is allowed for operation, with the valve closed or open. When the downstream pressure is 0 MPa, this becomes the maximum operating pressure.

2. Minimum operating pressure differential

The minimum pressure differential (differential between the inlet pressure and the outlet pressure) required to keep the main valve fully opened.

3. Maximum system pressure

The maximum pressure that can be applied inside the pipelines (line pressure).

(The pressure differential of the solenoid valve unit must be less than the maximum operating pressure differential.)

4. Proof pressure

The pressure which must be withstood without a drop in performance after returning to the operating pressure range. (value under the prescribed conditions)

Electrical Terminology

1. Apparent power (VA)

Volt-ampere is the product of voltage (V) and current (A). Power dissipation (W): For AC , $W = V/A \cos\theta$. For DC, W = V/A.

(Note) $\cos\theta$ shows power factor. $\cos\theta = 0.6$

2. Surge voltage

A high voltage which is momentarily generated in the shut-off unit by shutting off the power.

3. Degree of protection

A degree defined in the "JIS C 0920: Waterproof test of electric machinery/appliance and the degree of protection against the intrusion of solid foreign objects".

IP65: Dusttight, Low jetproof type

"Low jetproof type" means that no water intrudes inside an equipment that could hinder from operating normally by means of discharging water for 3 minutes in the prescribed manner. Take appropriate protection measures, since a device is not usable in an environment where a water drop is splashed.

Others

1. Material

NBR: Nitrile rubber

FKM: Fluoro rubber - Trade names: Viton®, Dai-el®, etc.

EPDM: Ethylene propylene rubber

PTFE: Polytetrafluoroethylene resin – Trade names: Teflon®,

Polyflon®, etc.

2. Oil-free treatment

The degreasing and washing of wetted parts.

3. Passage symbol

In the JIS symbol ($abla \Box \Box \uparrow h$) IN and OUT are in a blocked condition ($\dot{}$ $\dot{}$), but actually in the case of reverse pressure (OUT>IN), there is a limit to the blocking.

(运口声) is used to indicate that blocking of reverse pressure is not possible.

How to Order Manifold Assemblies (Example)

Enter the valve and blanking plate to be mounted under the manifold base part number.

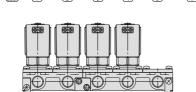

Example

Ε

VVX211C-05-1 1 set * VX2111-1G1 4 sets * VVX21-3A 1 set

"*" is the symbol for mounting.

Add an "*" in front of the part numbers
for solenoid valves, etc. to be mounted.

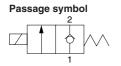

Enter the product's part number in order, counting the 1st station from the left in the manifold arrangement, when viewing the individual port in front.

Refer to the table (2)-(2).

The following safety instructions are intended to prevent a hazardous situation and/or equipment damage. These instructions indicate the level of potential hazard by all safety practices, including labels of "Caution", "Warning" or "Danger". To ensure safety, please observe ISO 4414 Note 1), JIS B 8370 Note 2).

Caution: Operator error could result in injury or equipment damage.

Warning: Operator error could result in serious injury or loss of life.

⚠ Danger : In extreme conditions, there is a possible result of serious injury or loss of life.

Note 1) ISO 4414: Pneumatic fluid power – General rules relating to systems Note 2) JIS B 8370: General Rules for Pneumatic Equipment

∧ Warning

1. The compatibility of equipment is the responsibility of the person who designs the system or decides its specifications.

Since the products specified here are used in various operating conditions, their compatibility with a specific system must be based on specifications, post analysis and/or tests to meet a specific requirement. The expected performance and safety assurance will be the responsibility of the person who has determined the compatibility of the system. This person should continuously review the suitability of all items specified, referring to the latest catalog information and taking into consideration the possibility of equipment failure when configuring a system. Be particularly careful in determining the compatibility with the fluid to be used.

2. Only trained personnel should operate machinery and equipment.

The fluid can be dangerous if handled incorrectly. Assembly, handling or maintenance of the system should be performed by trained and experienced operators.

- 3. Do not service machinery/equipment or attempt to remove components until the safety is confirmed.
 - 1. Inspection and maintenance of machinery/equipment should only be performed once measures to prevent falling or runaway of the driven object have been confirmed. Measures to prevent danger from a fluid should also be confirmed.
 - 2. When equipment is to be removed, confirm the safety processes mentioned above, release the fluid pressure and be certain there is no danger from fluid leakage or fluid remaining in the system.
 - 3. Carefully restart the machinery, confirming that safety measures are being implemented.
- 4. Contact SMC if the product is to be used in any of the following conditions:
 - 1. Conditions and environments beyond the given specifications, or if product is used outdoors.
 - 2. With fluids whose application causes concern due to the type of fluid or additives, etc.
 - 3. An application which has the possibility of having a negative effect on people, property, or animals, and therefore requires special safety analysis.

Be sure to read before handling.

For detailed precautions on each series, refer to the main text.

Design

⚠ Warning

 Cannot be used as an emergency shutoff valve, etc.

The valves presented in this catalog are not designed for safety applications such as an emergency shutoff valve. If the valves are used in this type of system, other reliable safety assurance measures should also be adopted.

2. Extended periods of continuous energization

The solenoid coil will generate heat when continuously energized. Avoid using in a tightly shut container. Install it in a well-ventilated area. Furthermore, do not touch it while it is being energized or right after it is energized.

3. This solenoid valve cannot be used for explosion proof applications.

4. Maintenance space

The installation should allow sufficient space for maintenance activities (removal of valve, etc.).

5. Liquid rings

In cases with a flowing liquid, provide a bypass valve in the system to prevent the liquid from entering the liquid seal circuit.

6. Actuator drive

When an actuator, such as a cylinder, is to be driven using a valve, take appropriate measures to prevent potential danger caused by actuator operation.

7. Pressure (including vacuum) holding

It is not usable for an application such as holding the pressure (including vacuum) inside of a pressure vessel because air leakage is entailed in a valve.

- When the conduit type is used as equivalent to an IP65 enclosure, install a wiring conduit, etc.
- When an impact, such as water hammer, etc., caused by the rapid pressure fluctuation is applied, the solenoid valve may be damaged. Give an attention to it.

Selection

⚠ Warning

1. Confirm the specifications.

Give careful consideration to the operating conditions such as the application, fluid and environment, and use within the operating ranges specified in this catalog.

2. Fluid

1) Type of fluid

Before using a fluid, confirm whether it is compatible with the materials from each model by referring to the fluids listed in this catalog. Use a fluid with a dynamic viscosity of 50 mm²/s or less. If there is something you do not know, please contact us.

2) Inflammable oil, Gas,

Confirm the specification for leakage in the interior and/or exterior area.

Selection

⚠ Warning

3) Corrosive gas

Cannot be used since it will lead to cracks by stress corrosion or result in other incidents.

- 4) Use an oil-free specification when any oily particle must not enter the passage.
- 5) Applicable fluid on the list may not be used depending on the operating condition. Give adequate confirmation, and then determine a model, just because the compatibility list shows the general case.

3. Fluid quality

The use of a fluid which contains foreign matter can cause problems such as malfunction and seal failure by promoting wear of the valve seat and armature, and by sticking to the sliding parts of the armature, etc. Install a suitable filter (strainer) immediately upstream from the valve. As a general rule, use 80 to 100 mesh. When used to supply water to boilers, substances such as calcium and magnesium which generate hard scale and sludge are included. Since this scale and sludge can cause the valve to malfunction, install water softening equipment, and a filter (strainer) directly upstream from the valve to remove these substances.

4. Air quality

1) Use clean air.

Do not use compressed air which includes chemicals, synthetic oils containing organic solvents, salt or corrosive gases, etc., as it can cause damage or malfunction.

2) Install air filters.

Install air filters close to valves at their upstream side. A filtration degree of $5\mu m$ or less should be selected.

3) Install an air dryer or after cooler, etc.

Compressed air that includes excessive drainage may cause malfunction of valves and other pneumatic equipment. To prevent this, install an air dryer or after cooler, etc.

If excessive carbon powder is generated, eliminate it by installing mist separators at the upstream side of valves.

If excessive carbon powder is generated by the compressor, it may adhere to the inside of the valves and cause a malfunction.

Refer to SMC's Best Pneumatics catalog Vol. 14 for further details on compressed air quality.

5. Ambient environment

Use within the operable ambient temperature range. Confirm the compatibility between the product's composition materials and the ambient atmosphere. Be sure that the fluid used does not touch the external surface of the product.

6. Countermeasures against static electricity

Take measures to prevent static electricity since some fluids can cause static electricity.

7. For the low particle generation specification, confirm us separately.

Be sure to read before handling.

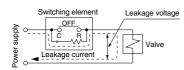

For detailed precautions on each series, refer to the main text.

Selection

⚠ Caution

1. Leakage voltage

Particularly when using a resistor in parallel with a switching element and using a C-R element (surge voltage suppressor) to protect the switching element, take note that leakage current will flow through the resistor, C-R element, etc., creating a possible danger that the valve may not turn off.

AC coil: 20% or less of rated voltage DC coil: 2% or less of rated voltage

2. Low temperature operation

- The valve can be used in an ambient temperature of between -10 to -20°C, however take measures to prevent freezing or solidification of impurities, etc.
- 2. When using valves for water application in cold climates, take appropriate countermeasures to prevent the water from freezing in tubing after cutting the water supply from the pump, by draining the water, etc. When heating by steam, be careful not to expose the coil portion to steam. Installation of dryer, heat retaining of the body is recommended to prevent a freezing condition in which the dew point temperature is high and the ambient temperature is low, and the high flow runs.

Mounting

Marning

1. If air leakage increases or equipment does not operate properly, stop operation.

After mounting is completed, confirm that it has been done correctly by performing a suitable function test.

2. Do not apply external force to the coil section.

When tightening is performed, apply a wrench or other tool to the outside of the piping connection parts.

3. Be sure not to position the coil downwards.

When mounting a valve with its coil positioned downwards, foreign objects in the fluid will adhere to the iron core leading to a malfunction.

4. Do not warm the coil assembly with a heat insulator, etc.

Use tape, heaters, etc., for freeze prevention on the piping and body only. They can cause the coil to burn out.

- Secure with brackets, except in the case of steel piping and copper fittings.
- 6. Avoid sources of vibration, or adjust the arm from the body to the minimum length so that resonance will not occur.
- 7. Painting and coating

Warnings or specifications printed or labeled on the product should not be erased, removed or covered up.

Piping

⚠ Caution

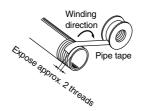

1. Preparation before piping

Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove chips, cutting oil and other debris from inside the pipe.

2. Wrapping of pipe tape

When connecting pipes, fittings, etc., be sure that chips from the pipe threads and sealing material do not enter the valve.

Furthermore, when pipe tape is used, leave 1.5 to 2 thread ridges exposed at the end of the threads.

- Avoid connecting ground lines to piping, as this may cause electric corrosion of the system.
- Always tighten threads with the proper tightening torque.

When attaching fittings to valves, tighten with the proper tightening torque shown below.

Tightening Torque for Piping

Connection threads	Proper tightening torque N⋅m
Rc 1/8	7 to 9
Rc 1/4	12 to 14
Rc 3/8	22 to 24
Rc 1/2	28 to 30

5. Connection of piping to products

When connecting piping to a product, refer to its instruction manual to avoid mistakes regarding the supply port, etc.

6. Steam generated in a boiler contains a large amount of drainage.

Be sure to operate it with a drain trap installed

7. In applications such as vacuum and non-leak specifications, use caution specifically against the contamination of foreign matters or airtightness of the fittings.

Be sure to read before handling.

For detailed precautions on each series, refer to the main text.

Wiring

⚠ Caution

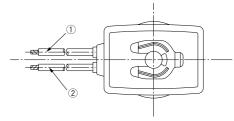

- As a rule, use electrical wire with a cross sectional area of 0.5 to 1.25mm² for wiring.
 Furthermore, do not allow excessive force to be applied to the lines.
- 2. Use electrical circuits which do not generate chattering in their contacts.
- 3. Use voltage which is within $\pm 10\%$ of the rated voltage. In cases with a DC power supply where importance is placed on responsiveness, stay within $\pm 5\%$ of the rated value. The voltage drop is the value in the lead wire section connecting the coil.
- 4. When a surge from the solenoid affects the electrical circuitry, install a surge absorber, etc., in parallel with the solenoid.
 - Or, adopt an option that comes with the surge voltage protection circuit. (However, a surge voltage occurs even if the surge voltage protection circuit is used. For details, please consult with us.)

Electrical Connections

Caution

Grommet

Class H coil: AWG18 Insulator O.D. 2.2 mm Class B coil: AWG20 Insulator O.D. 2.4 mm

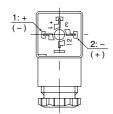

Rated voltage	Lead w	ire color
nateu voitage	1	2
DC (Class B only)	Black	Red
100 VAC	Blue	Blue
200 VAC	Red	Red
Other AC	Gray	Gray

^{*} There is no polarity. (For the low power consumption type, there is polarity.)

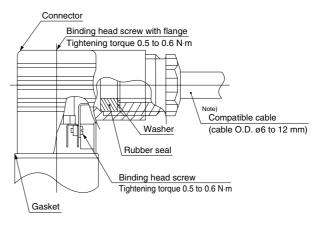

DIN connector (Class B only)

Since internal connections are as shown below for the DIN connector, make connections to the power supply accordingly.

Terminal no.	1	2
DIN terminal	+ (-)	– (+)

- There is no polarity
- Use compatible heavy duty cords with cable O.D. of ø6 to 12.
- Use the tightening torques below for each section.

Note) For an outside cable diameter of ø9 to 12 mm, remove the internal parts of the rubber seal before using.

Be sure to read before handling.

For detailed precautions on each series, refer to the main text.

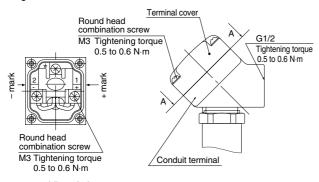

Electrical Connections

⚠ Caution

Conduit terminal

In the case of the conduit terminal, make connections according to the marks shown below.

- Use the tightening torques below for each section.
- Properly seal the terminal connection (G1/2) with the special wiring conduit, etc.

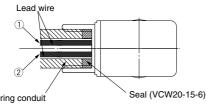

View A-A (Internal connection diagram)

Conduit

When used as an IP65 equivalent, use seal (part no. VCW20-15-6) to install the wiring conduit. Also, use the tightening torque below for the conduit.

Class H coil: AWG18 Insulator O.D. 2.2 mm Class B coil: AWG20 Insulator O.D. 2.4 mm

Bore size G1/2 Tightening torque 0.5 to 0.6 N·m

Operating Environment

- 1. Do not use the valves in an atmosphere having corrosive gases, chemicals, salt water, water, steam, or where there is direct contact with any of these.
- 2. Do not use in explosive atmospheres.
- 3. Do not use in locations subject to vibration or impact.
- 4. Do not use in locations where radiated heat will be received from nearby heat sources.
- 5. Employ suitable protective measures in locations where there is contact with water droplets, oil or welding spatter, etc.

Lubrication

⚠ Caution

1. This solenoid valve can be operated without lubrication.

If a lubricant is used in the system, use turbine oil Class 1, ISO VG32 (with no additive). But do not lubricate a valve with EPDM seal.

Refer to the table of brand name of lubricants compliant with Class 1 turbine oil (with no additive), ISO VG32.

Class 1 Turbine Oil (with no additive), ISO VG32

Classification of viscosity (cst) (40°C)	Viscosity according to ISO Grade	32
Idemitsu Kosan Co.,Ltd.		Turbine oil P-32
Nippon Mitsubishi Oil Corp.		Turbine oil 32
Cosmo Oil Co.,Ltd.		Cosmo turbine 32
Japan Energy Corp.		Kyodo turbine 32
Kygnus Oil Co.		Turbine oil 32
Kyushu Oil Co.		Stork turbine 32
Nippon Mitsubishi Oil Corp.		Mitsubishi turbine 32
Showa Shell Sekiyu K.K.		Turbine 32
Tonen General Sekiyu K.K.		General R turbine 32
Fuji Kosan Co.,Ltd.		Fucoal turbine 32

Please contact SMC regarding Class 2 turbine oil (with additives), ISO VG32.

Maintenance

⚠ Warning

1 Removing the product

The valve will reach a high temperature when used with high temperature fluids. Confirm that the valve temperature has dropped sufficiently before performing work. If touched inadvertently, there is a danger of being burned.

- Shut off the fluid supply and release the fluid pressure in the system.
- 2. Shut off the power supply.
- 3. Demount the product.

2. Low frequency operation

Switch valves at least once every 30 days to prevent malfunction. Also, in order to use it under the optimum state, conduct a regular inspection once a half year.

Maintenance

1. Filters and strainers

- 1. Be careful regarding clogging of filters and strainers.
- 2. Replace filter elements after one year of use, or earlier if the pressure drop reaches 0.1 MPa.
- 3. Clean strainers when the pressure drop reaches 0.1 MPa.

2. Lubrication

When using after lubricating, never forget to lubricate continuously.

3. Storage

In case of long term storage after use with heated water, thoroughly remove all moisture to prevent rust and deterioration of rubber materials, etc.

Exhaust the drain from an air filter periodically.

Operating Precautions

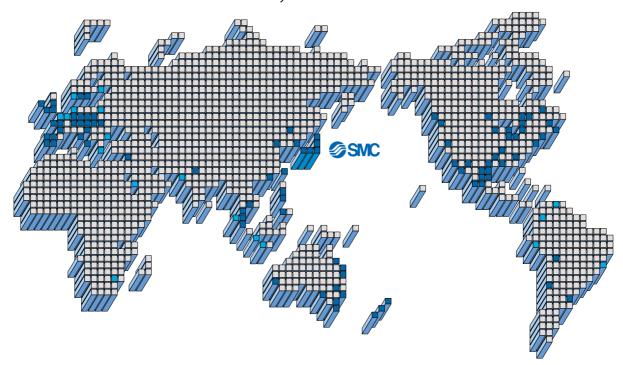

A Warning

 Valves will reach high temperatures from high temperature fluids. Use caution, as there is a danger of being burned if a valve is touched directly.
