1. Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of “Caution,” “Warning” or “Danger.”

They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)*1, and other safety regulations.

*1) ISO 4414: Pneumatic fluid power -- General rules relating to systems.
ISO 4413: Hydraulic fluid power -- General rules relating to systems.
IEC 60204-1: Safety of machinery -- Electrical equipment of machines. (Part 1: General requirements)

Caution indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.

Warning indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

Danger indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.

---

1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.

Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results.

The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product.

This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

2. Only personnel with appropriate training should operate machinery and equipment.

The product specified here may become unsafe if handled incorrectly.

The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

3. Do not service or attempt to remove product and machinery/equipment until safety is confirmed.

1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.

2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.

3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.

4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions:

1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.

2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.

3. An application which could have negative effects on people, property, or animals requiring special safety analysis.

4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.
1. Safety Instructions

**Caution**

1. The product is provided for use in manufacturing industries. The product herein described is basically provided for peaceful use in manufacturing industries. If considering using the product in other industries, consult SMC beforehand and provide specifications or a contract, if necessary. If anything is unclear, contact your nearest sales branch.

**Limited warranty and Disclaimer/Compliance Requirements**

The product used is subject to the following “Limited Warranty and Disclaimer” and “Compliance Requirements”. Read and accept them before using the product.

**Limited warranty and Disclaimer**

1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first. *2) Also, the product may have specified durability, running distance or replacement parts. Please consult your nearest sales branch.

2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided. This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.

3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

*2) Vacuum pads are excluded from this 1 year warranty. A vacuum pad is a consumable part, so it is warranted for a year after it is delivered. Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to the deterioration of rubber material are not covered by the limited warranty.

**Compliance Requirements**

1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.

2. The export of SMC products or technology from one country to another is governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of an SMC product to another country, ensure that all local rules governing that export are known and followed.
2. Product Outline

2.1 Features

The JXC93 uses operation instructions to control multiple actuators. The operation instructions are comprised of "step data" information, which contains actuator performance command data such as position, speed, or acceleration, etc. The step data is predefined in the controller setting software. An EtherNet/IP command, which specifies a step data number, is sent to the controller to start the operation based on the step data information.

Feature of the controller.

- **EtherNet/IP type**
  Control by EtherNet/IP is possible.

- **4 axes speed tuning control**
  Up to 4 axes speed tuning control is available for specifying step data.

- **Linear/ circular interpolation**
  Linear interpolation for up to 3 axes and circular interpolation between 2 axes are possible. Linear interpolation is possible by setting the target position and travel speed of the locus. For circular interpolation, the travel speed of the locus and the centre position must be set.

![Linear interpolation](image1)

![Circular interpolation](image2)

- **Return to origin**
  All axes are possible to return to origin using one 'return to origin' signal (SETUP) from EtherNet/IP. The order of the return to origin operation is possible to specify by parameters.

- **It is possible to set 512 steps of positioning or pushing operation in normal mode, and 2048 steps of positioning or pushing operation in extended mode.**
  Control the actuator according to the specified operation pattern by manipulating the memory allocated to the input/output port such as INP signal and DRIVE signal from EtherNet/IP. It is possible to operate all axes by using 1 step.

- **Data input method**
  It is possible to set the step data, parameters, monitor conditions, and reset alarms by communication via the USB port from a PC in which the controller setting software is installed.

⚠️ Caution

Please keep this manual safe for future use. It will be necessary to refer to this manual along with the operation manuals for other actuators and controller setting software at installation and fault finding. Keep this operation manual accessible for reference.
2.2 How to Order

How to order is shown below.

Applicable Actuator

<table>
<thead>
<tr>

To P1, P2

To MOT

To CI

Warning

Refer to 14. Common Precautions for wiring and cable
Use "USB cable (JXC-W1-2)" when communicating with a PC.

Caution

Connector "CI3 4" must be connected even when axis 3 and 4 are not used. If not, a "Modbus Error" alarm will be generated.
3. Procedures to Trial run

Install, wire, set and perform a trial run for the controller referring to the procedure below when using the product for the first time.

- Check the contents of the package
- Mounting the controller
- Software Installation
- Wiring and connecting
- Supply power. Start-up of controller setting software
- Parameters and Step data
- Check using JOG operation
- Operation test using Test Drive
- EtherNet/IP communication setting and checking
- Operation test by PLC

For “Installation of the software”, refer to this operation manual and the Installation Manual for the controller setting software (No.SFOD-OMT0008). For “Start-up of controller setting software”, “Parameters and step data”, “Check using JOG operation” and “Operation test using Test Drive”, please refer to the setting software operation manual (No.SFOD-OMT0012).

When this controller is used for the first time after purchase, do not upload the default values in the controller.

Please download the information which has been set by the controller setting software and use it.

3.1 Checking the contents of the package

After unpacking everything, check the description on the label to identify the controller and the number of accessories.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller (JXC93+)</td>
<td>1 pc.</td>
</tr>
<tr>
<td>Power cable for main control (Length 1.5m)</td>
<td>1 pc.</td>
</tr>
<tr>
<td>Motor drive power connector</td>
<td>2 pcs.</td>
</tr>
<tr>
<td>Motor control power supply connector</td>
<td>2 pcs.</td>
</tr>
<tr>
<td>DIN rail mounting bracket [Note 1]</td>
<td>1 set</td>
</tr>
</tbody>
</table>

Note 1) These items are included if you ordered by the part number for a set of controller.

[Options]

Controller setting kit (Product model No.: JXC-W1)

(Controller setting software and USB cable are included.)

If any parts are missing or damaged, please contact your distributor.
3.2 Mounting the controller
Refer to 4.4 Mounting for instructions on how to mount the controller.

3.3 Install the setting software and the driver
Install the controller setting software and driver software on the PC to be used.
For details, refer to the Installation Manual for the controller setting software (No.SFOD-OMT0008).

3.4 Wiring and connection
Connect the cables to the controller.
Refer to section 2.3 Product Configuration, 6.2 Wiring, and 7. EtherNet/IP Communication Connector for wiring details.

3.5 Power supply, Start-up of controller setting software, and Alarm check
(1) Supplying power
After supplying power for the motor control and motor drive, turn on the power supply for the main control.

<table>
<thead>
<tr>
<th>LED and switch</th>
<th>Colour</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR</td>
<td>Green</td>
<td>ON: Power ON</td>

</tr>
<tr>
<td>ALM</td>
<td>Red</td>
<td>ON: Alarm is generated</td>
</tr>
<tr>
<td></td>
<td></td>
<td>OFF: Alarm is not generated</td>
</tr>
</tbody>
</table>

Check that the PWR LED is ON.
If the green PWR LED is not ON, check the wiring of the power supply and the power supply voltage.

⚠️ Caution
After supplying power for the motor control and motor drive, turn on the power supply for the main control. Otherwise a “Modbus Error” alarm will be generated.
(2) Start-up of controller setting software
Using a PC with the controller setting software installed, start the application "SMC / JXC Controller" to start the setting software.
If the controller setting software is installed with the default setting, an icon will be created on the desktop. It is possible to start the setting software by double-clicking the icon.
When the setting software starts, the connection between the controller and PC is confirmed. The screen below will be displayed when the communication is established correctly.
However, when the setting software is started for the first time, this window will not appear.
When power is supplied to the controller for the first time, the title window will be displayed.
The following window will be displayed after setting the parameters of the controller and the connected actuator.

When selecting "No (N)", the controller will start without uploading. The title window shown below will be displayed.

When the PC is not able to communicate with the controller, the following screen is displayed.

When select "OK", the title window will be displayed.
After the initial title window is displayed, the following main window will be displayed.

The communication status between the controller and PC is indicated at the bottom of the main window.

<table>
<thead>
<tr>
<th>Display</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offline</td>
<td>Off-line state</td>
</tr>
<tr>
<td>Online</td>
<td>On-line state</td>
</tr>
</tbody>
</table>

When the PC is able to communicate with the controller, “On-line” status is established automatically.

If the communication is in the off-line state, the PC is not able to communicate with the controller. Please check the following.

- Check that power is supplied to the controller at the correct voltage.
- Check that the controller and the PC are connected to each other via the communication cable.
- Check that the USB driver is installed correctly.

(3) Alarm check

If the Alarm button at the top of the main window of the setting software flashes red an alarm has been generated.

It is possible to check the details of the generated alarm by clicking the Alarm button. Refer to 13.2 Alarms and countermeasures for details of the countermeasures against the alarm, and reset the alarm.
3.6 Parameters and Step data

When using for the first time or after changing the connected actuator, or when the settings of the controller or connected actuator have been changed, it is necessary to review the set parameters and step data.

It is possible to display parameters and step data as shown below.

(1) Select the actuator
Select "View(V)" at the top of the main window, and check the parameters.

![Parameter window](image)

The Parameter window will be displayed. Select the "Actuator selection" button. The Actuator selection window will be displayed.
Input the part number of the actuator to be used in the “Search from Part No. area.”

A list of part numbers of the actuators matching the conditions will be displayed by clicking the "Result" button. Select the actuator to be connected.

If the part number of the actuator to be used is already known, input the part number until stroke.

Example) When the LEY16RA-100BML is ordered, input ‘LEY16RA-100’.

When the LER series is used, input the part number including the rotation angle.

Example) When the LERH30K-3L is ordered, input ‘LERH30K-3’.

When there is no match in the results even when the stroke is input, the possible causes could be:

(a) No applicable stroke
   Input the part number without the stroke. Select the closest model to the actuator being used, with a stroke which is longer than that of the actuator being used.
   Example) When LEY16RA-75 is ordered, input ‘LEY16RA-100’.

(b) For LEFSH (High precision type)
   Input LEFS to search.
   Example) When LEFSH25RH-300 is ordered, input ‘LEFS25RH-300’

(c) When a Clean type (11-) or Secondary battery type (25A-) is ordered.
   Search without inputting 11- or 25A-, and find the actuator to which 11- or 25A- is applicable.
   Example) When 11-LEFSH16A-100BR is ordered, input ‘LEFS16A-100’

Caution

When the stroke parameter selected is longer than the stroke of the actuator to be used, the "position" input to the step data must not exceed the actuator stroke range.

When there is no actuator match, consult SMC.
Select the check box for the axis for which parameters are to be input (one or more boxes are possible to be selected). Select the "Execute" button. Axis parameters will be displayed in the Actuator selection window. The values input here are for display only, and are not written to the controller.

![Actuator selection window](image)

Display the parameters for all axes. Select the "Execute" button. The parameters are copied to the parameter window table.

![Parameter window](image)

**Caution**

Copying does not write parameters to the controller. Be sure to download the parameters following the procedure in section **3.6 (2) Setting parameters.**
(2) Setting parameters

Set the parameters such as for valid axis and electronic gear.

Check the parameters below and change them if necessary. For other items, refer to section 9.

**Settings and Data Entry.**

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Input range</th>
<th>Outline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile parameter</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Max step data Num</td>
<td>512 or 2048</td>
<td>Maximum step data. Change if necessary.</td>
</tr>
<tr>
<td>Activated axis</td>
<td>0 or 1</td>
<td>Set the validity of the axes. Set &quot;0&quot; (invalid) when no actuator is connected. Set &quot;1&quot; (valid) when connected.</td>
</tr>
<tr>
<td>ORIG order</td>
<td>1 to 4</td>
<td>The order for axes to return to origin. The order is assigned from 1 to 4. Multiple axes are possible to return to origin simultaneously by setting the same order number.</td>
</tr>
<tr>
<td>Undefined No.11</td>
<td>1 to 4096</td>
<td>Define the Electronic Gear. Undefined No.11: Electronic gear (numerator) Undefined No.12: Electronic gear (denominator)</td>
</tr>
<tr>
<td>Basic parameter</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Undefined No.11</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Undefined No.12</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Caution**

When interpolation is performed for actuators of different lead, the travel distance per pulse must be the same. Otherwise do not change the distance.

Set the electronic gear for Axis 2, 3 or 4 so that the travel distance for all of them are the same as Axis 1.

**Setting example**

<table>
<thead>
<tr>
<th>Axis</th>
<th>Actuator</th>
<th>Lead</th>
<th>Electronic gear ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis 1</td>
<td>LEY16C-300</td>
<td>2.5mm</td>
<td>1/1</td>
</tr>
<tr>
<td>Axis 2</td>
<td>LEY16B-300</td>
<td>5mm</td>
<td>25/50</td>
</tr>
<tr>
<td>Axis 3</td>
<td>LEY16A-300</td>
<td>10mm</td>
<td>25/100</td>
</tr>
</tbody>
</table>

Set Axis 2 and 3 so that the travel distance becomes 2.5mm per 800 pulse.

Electronic Gear ratio

= Lead of Axis 1 / Lead of Axis 2(or Axis 3)

= 2.5mm/5mm (or 2.5mm/10mm)

= 25/50 (or 25/100)
After setting parameters, select the "Download" button in the parameter window. Parameters in the parameter window will be written to the controller. Writing is completed when the progress bar disappears and then the setting software is ready to operate.

**It is necessary to turn off the power to the controller and turn it on again. The downloaded parameters will become valid after turning the power on again.**
3. Step data settings

Select "View(V)" at the top of the main window, and select "Step Data".

The Step data window will be displayed.

Select the "▼" button for the movement mode for the axis of the step number to be set. Select the movement mode shown in the list. Enter the necessary numerical data according to the selected movement mode.

The setting is different depending on the movement mode. Refer to section 9.4 Step Data for details.

After setting the step data, select the "Download" button in the step data window. The step data will be written to the controller. Writing is completed when the progress bar disappears and then the setting software is ready to operate.
3.7 Check using JOG operation

(1) Change to Remote mode

Change the mode to Remote mode at the top of the main window. The Servo will be turned on by selecting Remote mode.

Confirm that the Servo is ON. (Confirm SVRE ON in the status window.)

Select "View(V)" at the top of the main window, and select "Status".

The Status window will be displayed. When the Servo is ON, the SVRE box will turn blue in the Output signal area.

⚠️ Caution

When the power is supplied, it may take up to 20 seconds from servo ON to SVRE ON, depending on the actuator position or the conditions.
(2) Return to origin
Select "View(V)" at the top of the main window, and select "Teaching".

![Teaching window](image)

The teaching window will be displayed.

![Teaching window with highlighted Return to Origin tab](image)

Select the “Return to Origin” tab. Select "Return to Origin(●)" or "All axes Return to Origin".

When the return to origin setting is completed, SETON is ON. Confirm that the output signal SETON turns blue in the status window.
(3) JOG or Inching

Select the “JOG” or “Inching” tab.

(a) JOG

Set the “Speed”. The Position will move in the “+” or “-” direction as long as the “+” or “-” button is pressed.

(b) Inching

Set “Speed” for travel speed and “Moving” for travel distance. The Position will move in the “+” or “-” direction during setting.

Confirm that the connected actuator travels at the speed or distance according to the connected actuator setting.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>When perform return to origin operation, JOG function and Inching function for the first time, make sure that the parameter setting is correct.</td>
</tr>
<tr>
<td>When the electronic gear is set, make sure that the actuator travels for the set travel distance by performing the inching function.</td>
</tr>
<tr>
<td>It is possible that unexpected operation will result in accidents, injury, or damage to the system or actuator.</td>
</tr>
</tbody>
</table>
3.8 Operation test using Test Drive

Select "View(V)" at the top of the main window, and select "Test Drive".

![Image of SMC Controller interface]

The Test Drive window will be displayed.

![Image of Test Drive window]

It is possible to test the set step data in a specified order.

(1) Test Drive setting

Set the order of the step data number for testing in the test drive list window. The table below shows details of the items required.

<table>
<thead>
<tr>
<th>Items</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>Line number.</td>

</tr>
</tbody>
</table>

(2) Change to Remote mode

Turn on the Servo, referring to section 3.7 (1) Change to Remote mode.
(3) Return to origin
Confirm that SVRE is ON, refer to section 3.7 (1) Change to Remote mode. Then, select "All axes Return to Origin", and perform the "Return to origin" operation.

(4) Test drive starts
Confirm that SETON is ON, refer to section 3.7 (2) Return to origin.
Test drive starts by pressing the "Go" button, based on the test drive list.
Test drive is completed when the correct operation is confirmed. If the operation was not as expected, then refer to section 3.6 (3) Step data settings to revise the settings.

⚠️ Caution
Do not disconnect the USB cable while executing step data. The actuator will stop.
3.9 EtherNet/IP communication setting and checking

(1) Controller setting
   It is necessary to set the IP address using the rotary switches of the controller.
   Refer to 5.1 Controller setting (IP address setting) for details.

(2) PLC set up
   It is necessary to set the PLC parameters. This is possible to do by using an EDS file for the
   configuration of the controller.
   Refer to 5.2 PLC setting (Configuration) for details.

(3) LED Display
   The status of the LEDs on the front of the controller matches the table below when the setting of
   the PLC and controller are completed properly and EtherNet/IP communication is established.

<table>
<thead>
<tr>
<th>Description</th>
<th>LED status</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR</td>
<td>Green LED is ON</td>
<td>Power is supplied.</td>
</tr>
<tr>
<td>ALM</td>
<td>OFF</td>
<td>No alarm is generated.</td>
</tr>
<tr>
<td>MS</td>
<td>Green LED is ON</td>
<td>Operating normally</td>
</tr>
<tr>
<td>NS</td>
<td>Green LED is ON</td>
<td>EtherNet/IP communication is established.</td>
</tr>
</tbody>
</table>

Refer to 4.2 Parts Description for details of each LED.
EtherNet/IP communication between the PLC and controller is not established for cases other than
"[NS] green LED is on" on the front surface of the controller. (LED is off, LED flashes in green or
red, or the LED turns on red means communication problem has occured).

Caution

When the communication between the PLC and controller is not established, eliminate
the causes referring to 17. Troubleshooting.

3.10 Operation test by PLC

Refer to 8. Memory map for the allocation of the memory.
Check the return to origin and positioning operations by outputting signals from the PLC. Refer to 11.
Operation Instruction for directions.

</tbody>
</table>
4.4 Dimensions

(1) Direct mounting

(2) DIN rail mounting
4.5 Mounting

(1) Mounting

There are two ways to mount the controller. (Direct mounting with screws and DIN rail mounting) Controller mounting methods are shown below.

(a) Direct Mounting with four M5 screws

(b) DIN rail mounting

The figure on the right shows how to mount the DIN rail mounting brackets.

Secure the DIN rail mounting bracket using the mounting screws (M5 x 8) 2 places on one side (4 places on both sides). (Appropriate tightening torque: 3.0Nm)

Secure the DIN rail mounting bracket using the holding screws (M5 x 14). 1 place on one side (2 places on both sides). Tighten for approximately 2 threads. Do not tighten completely.

The figure below shows how to mount the controller to the DIN rail. Hook part A on to the DIN rail.

Press part B on to the DIN rail and tighten the holding screws (M5 x 14). (Appropriate tightening torque: 0.4 to 0.6Nm)
(2) Grounding
Fit the grounding cable with crimped terminal between the M3 screw and shakeproof washer as shown below and tighten the screw.

---

**Caution**

The cable with crimped terminal and shakeproof washer must be prepared by the user.
The controller must be connected to Ground to reduce noise.
**Caution**

(1) A dedicated ground connection must be used. Grounding should be to a D-class ground (ground resistance of 100Ω or less).

(2) The cross sectional area of the grounding cable should be 2mm² minimum. The grounding point should be as near as possible to the controller, to keep the grounding cable as short as possible.

![Diagram of dedicated and shared grounding](image)

Dedicated grounding: Good
Shared grounding: Not acceptable

(3) Mounting location

Design the size of the control panel and the installation so that the temperature surrounding the controller is 40°C or less. Mount the controller vertically with 50 mm or more space at the top and bottom of the controller as shown below.

Establish the space more than 100mm between the front of the controller and a door (lid) so that the connectors are possible to connect and disconnect. Leave enough space between the controllers so that the operating temperature of the controllers remains within the specification range. Allow sufficient space for mounting. Avoid mounting the controller near a vibration source, such as a large electromagnetic contactor or no-fuse breaker on the same panel.

![Diagram of mounting location](image)

**Caution**

If the mounting surface for the controller is not flat or is uneven, excessive stress could be applied to the case, which could cause failure. Mount on a flat surface.
5. Initial Setting Method

Initial setting of the controller and PLC is necessary for the communication with EtherNet/IP.

5.1 Controller setting (IP address setting)

IP address setting is necessary to distinguish the controller on the EtherNet/IP network. IP address is set by the rotary switches of the controller.

Use a flat blade watchmaker’s screwdriver of the size shown below when setting the rotary switches.

![Magnified view of the end of the flat blade screwdriver](image)

<table>
<thead>
<tr>
<th>Setup</th>
<th>IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>x100</td>
<td>x10</td>
</tr>
</tbody>
</table>
| 0     | 0   | 0  | Remote Control mode \(^{Note 1)}
| 0     | 0   | 1  | 192.168.1.1 (Factory default value)
| 0     | 0   | 2  | 192.168.1.2
|      |     |    | :    |
| 2     | 5   | 4  | 192.168.1.254
| 2     | 5   | 5  | DHCP mode \(^{Note 2)}
| 2     | 5   | 6  | Unused
|      | 9   | 9  |

\(^{Note 1)} The mode to set IP address by DHCP server.

When "BOOTP/DHCP Server" provided by Rockwell Automation is used after IP address setting, user is possible to choose whether or not to obtain an IP address by the settings below when power is supplied to the controller again.

Enable DHCP: Controller acquires an IP address again from the DHCP server when power is supplied to the controller again. The controller deletes the information of IP address when the power supply is removed.

Disable DHCP: Controller does not acquire an IP address from the DHCP server when power is supplied to the controller again. Even when the power supply is removed, the controller holds the IP address when "Disable DHCP" setting is selected.

\(^{Note 2)} The mode to set IP address by DHCP server.

Controller acquires an IP address again from the DHCP server when power is supplied to the controller again after setting IP address. The controller deletes the information of IP address when the power supply is removed.

\(\textbf{Caution}\)

1. The power supply should be off while setting the switches.
   This may cause damage to the controller.

2. If the saved IP address in the Remote Control mode is forgotten, change to DHCP mode and re-assign the correct IP address.
   The saved IP address will be lost. But when return to the Enable DHCP from Disable BOOTP/DHCP, it is possible to set the new IP address from BOOTP/DHCP server.
5.2 PLC setting (Configuration)

Setting (configuration) of the PLC is necessary to establish EtherNet/IP communication with the controller.

It is possible to use an EDS file for the configuration of the controller. It is possible to download the EDS file designated for this controller by the URL shown below.

It is possible to download by the URL shown below the icons designated for this controller.

For the setting using EDS file, please refer to the operation manual of the PLC.

URL: http://www.smcworld.com

Documents/Download → Instruction Manuals → Electric Actuators → JXC93 → Configuration File → jxc93_v10.zip

The content of jxc93_v10.zip file are as follows:

- Icons  jxc93_1.ico
5.3 Setting of EtherNet/IP™ using RSLogix5000™

Method to connect the JXC93 to the Rockwell Automation EtherNet/IP™ module (master) is shown below. Refer to the Operation Manual of the RSLogix5000™ for the detailed operation.

- This figure shows the display of Rockwell Automation software, RSLogix5000™.
- Select [EtherNet/IP™ module] in [I/O Configuration] folder, then select [New Module].

![Display of Rockwell Automation software, RSLogix5000™]

- The [Select Module] screen is displayed. Select [ETHERNET-MODULE Generic Ethernet Module], then select [Create].

![Select Module screen with [ETHERNET-MODULE Generic Ethernet Module] selected]
[Module Properties] screen is displayed. Perform each setting.

1. Name: Enter the required unit name.
2. Comm Format: Select the data format of Connection Parameters.
3. IP Address: Enter the IP address setting for the JXC93.
4. Assembly Instance: Perform setting as shown below.

<td>The rated temperature of the insulation coating should be 60°C or more.</td>
</tr>
<tr>
<td>Stripped wire length</td>
<td>![striped wire diagram]</td>
</tr>
</tbody>
</table>

When the wire is inserted into the motor drive power connector, insert only the stripped part of the wire.
Motor control power supply connector: CI

Manufactured by Phoenix Contact (Part number FK-MC0.5/5-ST-2.5)

Prepare the electrical wiring according to the following specifications (to be prepared by the user).

<table>
<thead>
<tr>
<th>Item</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicable wire size</td>
<td>Single, Stranded wire → AWG20 (0.5mm²)</td>
</tr>
<tr>
<td></td>
<td>The rated temperature of the insulation coating should be 60°C or more.</td>
</tr>
<tr>
<td>Stripped wire length</td>
<td>8mm or less</td>
</tr>
</tbody>
</table>

When the wire is inserted into the motor control power supply connector, insert only the stripped.

⚠️ Caution

Do not connect multiple wires into one terminal.

Contact failure or short circuit to adjacent wire may lead to malfunction or fire.
6.2 Wiring

Connect the main control power supply, motor drive and motor control power supply while referring to (1) to (3) below, and then insert into the controller C PWR, Cl and M PWR.

(1) Wiring of the power supply connector

Connect the main control power supply 24V and 0V to the main control power supply connector +24V and 24-0V terminals.

Connect the motor drive and motor control power supply 24V and 0V to the motor drive power connector M24V and 0V terminals.

Connect the motor drive and motor control power supply 24V to the motor control power supply connector C24V terminal.

---

**Caution**

(1) Do not use a power supply with “inrush current protection” for the motor drive and motor control power supply. The power supply capacity should be greater than the “Momentary maximum power consumption” of the actuator specifications.

(2) Connector ‘CI3 4’ must be connected even when Axis 3 and 4 are not used. If not, a “Modbus Error” alarm will be generated.

(3) The motor power and motor control power supply should be powered at the same time or prior to the main control power supply. If the sequence of these power supplies is different then a “ModbusError” alarm will be generated.
(2) Wiring of the stop switch

A stop switch must be installed by the user to stop the actuator in abnormal situations. The actuator stops its operation when the external shutdown switch is activated.

- Stop (Stop switch)

To stop the controller, connect the stop switch (B contact) between the motor drive and motor control power supply and the EMG terminal of the motor control power supply connector.

Motor control power supply connector

- Stop (Stop relay contact)

If there is a separate shutdown circuit for the whole installation or there are multiple controllers with different power supplies, connect a relay (B contact) between the motor drive and motor control power supply and the EMG terminal of the motor control power supply connector. (Circuit example: The Figure below shows the stop status).

Caution

When the EMGx input is turned off (0V) during operation, the corresponding actuator will stop with maximum deceleration and the servo will be turned off there after.
Motor power shutdown (relay contact)

If it is necessary to have a circuit to shutdown the motor drive power externally, relay contacts should be placed between the motor drive and motor control power supply and the M24V of the motor control power supply connector and the EMG terminal of the motor control power supply connector. (Circuit example: The Figure below shows the stop status)

Warning

1. If it is necessary to have a circuit to shutdown the motor power supply, relay contacts should be placed between the motor drive and motor control power supply and the M24V terminal of the motor drive power connector and the EMG terminal of the motor control power supply connector. The actuator may make unexpected movement.
2. Do not perform a return to origin operation (SETUP is ON) when the motor drive power (M24V) is disconnected.
   The controller cannot recognize the correct origin point if a return to origin instruction is made with the motor drive power (M24V) disconnected.
3. When wiring the stop switch, connect the switch such that EMG1 to EMG4 are shut down together.
## 7. EtherNet/IP communication connector

EtherNet/IP communication connector (P1 and P2) specifications are shown below.

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Function</th>

<td>*ALARM turns OFF when an alarm is generated to one or more actuator. (Reverse of OR of *ALARM1 to *ALARM4) <em>(Note2)</em></td>
</tr>
</tbody>
</table>

Note 1) When power is supplied, it may take up to 20 seconds from turning ON the Servo (SVON signal) to SVRE signal turning ON, depending on the actuator position or conditions.

Note 2) Negative logic signal.

Note 3) For BUSY and AREA signals, use BUSY1 to BUSY4 and AREA1 to AREA4.
## (2) PLC output port signals (from the PLC to controller)

<table>
<thead>
<tr>
<th>Signal name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN0</td>
<td>Step data instruction Bit No. (Standard: When 512 is used)</td>
</tr>
<tr>
<td>IN1</td>
<td>Step data instruction Bit No. (Input is instructed in the combination of IN0 to IN8.) Ex. (Assign step data No.3)→ “00000011”</td>
</tr>
<tr>
<td>IN2</td>
<td>Step data instruction extended mode bit No (Extended: 2048 is used)</td>
</tr>
<tr>
<td>IN3</td>
<td>Setup to Return to Origin Actuators return to origin based on the order of setting for return to origin. When SVRE is ON, the SETUP operation (return to origin) will be performed. During the SETUP operation, BUSY will be turned ON and after completion of the SETUP operation, SETON and INP will be turned ON.</td>
</tr>
<tr>
<td>IN4</td>
<td>Hold of operation All axes in operation are paused. If HOLD is ON during operation, the speed decreases at maximum deceleration of the basic parameter until the actuator stops. The remaining stroke will be on hold as long as HOLD is ON and when HOLD is turned OFF, the actuator restarts to travel the remaining stroke.</td>
</tr>
<tr>
<td>IN5</td>
<td>Drive Operation instruction Read the step data from IN0 to IN8 while the DRIVE signal is ON and start operation. The number of ongoing steps is output to the OUT terminal when the DRIVE signal is ON.</td>
</tr>
</tbody>
</table>

### Caution

1. Do not command SETUP or DRIVE while the HOLD is ON. The actuator may make unexpected movements.
2. While HOLD is ON, do not move the actuator position. Changing the residual travel distance may cause inconsistency with the target position.
3. HOLD is invalid during return to origin operation.
### Signal name | Description
--- | ---
**RESET** | Alarm reset and interruption of operation
When RESET is turned ON during operation, the speed decreases at maximum deceleration of the basic parameter until the actuator stops. INP and OUT0 to OUT10 are OFF. (However, if the actuator is stopped within the in-position range, the INP will be turned ON).
An Alarm is reset when the RESET signal is turned ON if an alarm has been generated. (Some alarms cannot be reset by the RESET command).

⚠️ **Caution**

1. Do not command SETUP or DRIVE while the RESET is ON. The actuator may make unexpected movements.
2. If the RESET is ON during a return to origin operation, return to origin may not be available when the RESET is turned OFF. In this case, turn on the servo, and then turn on the SETUP.

**SVON** | Servo ON instruction
When SVON is ON, the servo motor for all axes will be turned ON. When SVON is OFF, the servo motor will be turned OFF.

Note 1) When power is supplied, it may take up to 20 seconds from Servo ON to SVRE ON, depending on the actuator position or conditions.

The table below shows the changes in the signal with respect to the state of the controller.

<table>
<thead>
<tr>
<th>Status</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller powered down [SVOFF] with no motion</td>
<td>OFF</td>
</tr>
<tr>
<td>Controller powered down [SVON] with no motion</td>
<td>OFF</td>
</tr>
<tr>
<td>During Return to origin</td>
<td>ON</td>
</tr>
<tr>
<td>The actuator is at the origin, on completion of [SETUP]</td>
<td>OFF</td>
</tr>
<tr>
<td>During movement by positioning/pushing operation</td>
<td>ON</td>
</tr>
<tr>
<td>The actuator is paused by [HOLD]</td>
<td>OFF</td>
</tr>
<tr>
<td>On completion of the positioning operation.</td>
<td>OFF</td>
</tr>
<tr>
<td>Stopped due to pushing a workload in pushing operation.</td>
<td>OFF</td>
</tr>
<tr>
<td>Stopped due to no detection of a workload in pushing operation.</td>
<td>OFF</td>
</tr>
<tr>
<td>Servo is OFF after return to origin.</td>
<td>OFF</td>
</tr>
<tr>
<td>EMG signal stop from the CI connector after the actuator is at the origin.</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Note 1) The output turns on when the actuator is within the range defined in the basic parameter setup.

Note 2) The output is updated due to the transition of (OFF→ON) of the DRIVE signal.

Note 3) Retain the previous state.

Note 4) The output turns on when the actuator is “In position” according to the step data.
9. Setting Data Entry

In order to move the actuator to a specific position, it is necessary to program the parameters and step data in the controller using a PC with the controller setting software installed. The data entered using the controller setting software will be stored in the memory of the controller.

9.1 Profile parameter

The “Profile parameter” is the setting data for the controller specifications.

Note:
- “XX” = Become effective just after storing in the controller
- “X” = Become effective after restarting the controller
- “=” = The parameter cannot be changed (fixed value)

</tr>
</tbody>
</table>

Note1) The range varies depending on the actuator. Refer to the actuator operation manual for more details.

Caution

Simultaneous return to origin of 4 axes is not synchronous.
### 9.2 Basic parameter

The “Basic parameter” is the data to define the operating conditions of the controller, conditions of the actuator, etc.

**Activation:**
- “XX” = Become effective just after storing in the controller
- “X” = Become effective after restarting the controller
- “-” = The parameter cannot be changed (fixed value).

</tr>
</tbody>
</table>

**Note1)** The range varies depending on the actuator. Refer to the actuator operation manual for more details.

-49-
<table>
<thead>
<tr>
<th>Description</th>
<th>Input range</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Undefined No.11     | 1 to 4096   | Define the electronic Gear.  
- Undefined No.11:  "Electronic Gear (numerator)"  
- Undefined No.12:  "Electronic Gear (denominator)"  
This product controls the LE series motor (800 pulse per rotation).  
Please refer to [Supplement 1. Actuator Specifications](#) for the travel distance of the motor per rotation.  
[Setting example]  
(1) "Electronic Gear (numerator): 1", "Electronic Gear (denominator): 1"  
→ The motor makes one turn when 800 pulses are input.  
(2) "Electronic Gear (numerator): 1", "Electronic Gear (denominator): 2"  
→ The motor makes one turn when 1600 pulses are input.  
(3) "Electronic Gear (numerator): 2", "Electronic Gear (denominator): 1"  
→ The motor makes one turn when 400 pulses are input.  
"Electronic Gear (numerator): 1", "Electronic Gear (denominator): 1" is recommended. If other values are entered, vibration or noise of the actuator could result.  
When "0" is set, it is recognized as "1". When a value greater than "4097" is set, it is recognized as "4096".  

| Undefined No.12     | 1 to 4096   | ![Caution](#)  
When interpolation is performed for the actuators of different leads, the travel distance per pulse must be the same.  
Set the electronic Gear for Axis 2, 3 or 4 so that the travel distance are the same as Axis 1.  

[Setting example]  
<table>
<thead>
<tr>
<th>Axis</th>
<th>Actuator</th>
<th>Lead</th>
<th>Electronic gear ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis 1</td>
<td>LEY16C-300</td>
<td>2.5mm</td>
<td>1/1</td>

<tr>
<td>Axis 2</td>
<td>LEY16B-300</td>
<td>5mm</td>
<td>25/50</td>
</tr>
<tr>
<td>Axis 3</td>
<td>LEY16A-300</td>
<td>10mm</td>
<td>25/100</td>
</tr>
</tbody>
</table>

Set Axis 2 and 3 so that their travel distance becomes 2.5mm per 800 pulse.  
Electronic Gear ratio  
= Lead of Axis 1/ Lead of Axis 2(or Axis 3)  
=2.5mm/5mm  
(or 2.5mm/10mm)  
=25/50  
(or 25/100)

Note1) The range varies depending on the actuator. Refer to the actuator operation manual for more details.
### 9.3 Return to origin parameter

The “Return to origin parameter” is the setting data for the return to origin operation.  
**Activation:**  
- “XX” = Become effective just after storing in the controller  
- “X” = Become effective after restarting the controller  
- “-” = The parameter cannot be changed (fixed value).

**Note1)** The range varies depending on the actuator. Refer to the actuator operation manual for more details.
## 9.4 Step data

A “step data” is the data set to define the movement of the actuator. Total of 512 step data (9 attributes per step) are possible to handle by this controller. (When “2048” is set for “Max step data Num” in the Profile parameter, up to 2048 steps are possible to be use).

Each step data will become effective as soon as it is recorded into the controller.

(Example) Step data on the PC (controller setting software) screen

<td>Set the axis to be used (ENC 1 MOT to ENC 4 MOT).</td>
</tr>
</tbody>
</table>

#### Movement mode

- **Blank** × : Data invalid (No process)
  - Set blank for the axis which does not travel.
- **Absolute** ○ : Move the actuator to the absolute position.
- **Relative** ○ : Move the actuator to a relative position.
- **LIN– A** × : Move the actuator (3 axes) to the absolute position with linear interpolation.
- **LIN– I** × : Move the actuator (3 axes) to a relative position with linear interpolation.
- **CIR– R** × : Set Axis 1 as X and Axis 2 as Y. Move the actuator clockwise with circular interpolation. Specify the target coordinate and central coordinate from the current position using relative coordinate.
- **CIR– L** × : Set Axis 1 as X and Axis 2 as Y. Move the actuator counterclockwise with circular interpolation. Specify the target coordinate and central coordinate from the current position using relative coordinate.
- **SYN– I** × : Move the actuator to a relative position with Speed tuning control.

### Speed

- **From minimum value to “Max speed” of basic parameter**
  - The speed to move to the target position. (Unit: mm/s)
  - Refer to (1) to (5) on page 53 for the speed setting for movement mode.

**Note1)** The range varies depending on the actuator. Refer to the actuator operation manual for more details.
<table>

**Caution**

It is not possible to set more than one movement method in one step data.
10. Description of operation

10.1 Return to origin

After entering the step data, it is necessary to perform a return to origin operation before positioning the actuator. (To ensure the position of origin)

The actuator moves in the Return to origin direction (*dependent on the actuator) from the initial position at the moment of power-on. Refer to (1) in the figure below.

When the actuator reaches the end of travel limit it pauses for a short time. The controller recognizes the position as the end of travel limit of the actuator. Then, the actuator moves at a low speed in the direction opposite to the Return to origin direction. The position after the travel ("(2)" of the figure below) becomes the origin.

Return to Origin position command → Travel in the set Origin position direction → Stop traveling → Reverse travel → Set the Origin position

Return to Origin position reference example

⚠️ Caution

The Return to origin direction is dependent upon the actuator.
10.2 Positioning Operation

When the “Pushing selection” step data is "0" for a Positioning operation.

The actuator moves to the target position specified by the step data “Position.”

- Positioning Operation (Example)

Example) After a Return to origin, move the 4 axes from the origin to a 50mm position at 100mm/s (Step No.1). Next, move the actuator to a 100mm position by moving it 5 times consecutively, 10mm at a time, at a speed of 50 mm/s (Step No. 2).

Operation (Example)

Axis 1
Motor
Load
Actuator
0mm 50mm 60mm 100mm
Origin position
End position

Axis 2
Motor
Load
Actuator
0mm 50mm 60mm 100mm
Origin position
End position

Axis 3
Motor
Load
Actuator
0mm 50mm 60mm 100mm
Origin position
End position

Axis 4
Motor
Load
Actuator
0mm 50mm 60mm 100mm
Origin position
End position
Select Step No.1. (Turn IN0 ON.)

The Motor starts to move to the position set in Step No.1.

Step No.1 output turns on. (OUT0 is turned ON)

INP turns OFF.

The "BUSY" turns ON.

Turn the DRIVE OFF.

"INP" is turned ON.

"BUSY" is turned OFF.

The move to the position set in Step Data No.1 is completed.

Select Step No.2. (Turn the IN0 OFF, and the IN1 ON.)

Turn ON "DRIVE" input.

Start moving to 10mm from the current position.

Step No.2 is turned ON. (OUT1 is turned ON)

"INP" is turned OFF.

"BUSY" is turned ON.

"DRIVE" is turned OFF.

"INP" is turned ON.

"BUSY" is turned OFF.

The move to 10mm away is completed.
10.3 Pushing Operation

When the “Pushing selection” step data is "1", for a pushing operation.
First a positioning operation is performed to the “Target” position and according to the “Speed” set in the step data. The pushing operation starts from this “Position” for a maximum distance defined by the “Positioning width”.
The actuator pushes the load with a force no more than the maximum force set for the “Pushing force” in the profile parameters.

(1) Successful pushing operation

During the pushing operation, if the pushing force is greater than the value specified by the “Trigger level” set in the profile parameters for a specified time, the INP will be turned ON. The pushing force applied is set in the profile parameters and continues even after the INP is ON.

It is regarded that the pushing operation is completed successfully when two of the conditions below are satisfied.

**Condition 1)** The BUSY is OFF

**and**

**Condition 2)** The INP is ON

(2) Unsuccessful Pushing operation (not pushing).

If the pushing operation is not completed even after the actuator moves over the range specified in the step data from the target position (the starting point of the pushing operation), the operation will be completed.

In such a case, the INP and BUSY will be turned OFF.
(3) Movement of the workpiece after completing the pushing operation

(a) The workpiece moves in the pushing direction.

After completing the pushing operation, if the reaction force from the workpiece becomes smaller, the actuator may move with a force smaller than that specified in the "Trigger level" of the profile parameter.

In this case, the INP will be turned OFF and the actuator moves within the positioning range according to the balance of the force.

During the pushing operation, if the pushing force is higher than the value defined by the "Trigger level" in the profile parameter for a specified time, the INP will be turned ON again.

(b) Movement of the workpiece in the direction opposite to the pushing direction

(The actuator is pushed back since the reaction force from the workpiece is too large.)

After completing the pushing operation, if the reaction force from the workpiece becomes larger, the actuator may be pushed back. In this case, while the INP is ON, the actuator will be pushed back to the point where the reaction force and the actuator pushing force are balanced (pushed back toward the target position).

If the actuator is pushed back beyond the position of the pushing start, the INP will turn OFF.
Example) After a Return to origin, move 4 axes from the origin to 100mm position at 100mm/s.
From the 100mm position, pushing for a maximum of 5mm at a speed of 10mm/s
(profile parameter: Pushing speed) at 50% or lower of thrust (profile parameter: Pushing force) (Step No.1).
Then, move 4 axes to 50 mm position from the origin at 50mm/s from the Pushing completed position (position where "INP" is ON) (Step No.2).

Movement (ex.) Same operation for 4 axes

Step No.1 pushing operation (Example)

Step No.2 positioning operation (Example)
1) Select Step No.1. (Turn IN0 ON.)
2) Turn the “DRIVE” input ON.
   The Motor starts to move to the position set in Step No.1
3) Step No.1 is turned ON.
   (OUT0 is turned ON)
4) “INP” is turned OFF
5) “BUSY” is turned ON
6) “DRIVE” is turned OFF
   Move at low speed after passing the “Position” in Step No.1
   Push the workpiece with the specified pushing force
7) “INP” is turned ON
8) “BUSY” is turned OFF
   The move to the position set in Step No.1 is completed
9) Select Step No.2. (Turn the IN0 OFF, and the IN1 ON.)
10) Turn the “DRIVE” ON
    Start moving to the position of Step No.2
11) Step No.2 is turned ON.
    (OUT1 is turned ON)
12) “INP” is turned OFF
13) “BUSY” is turned ON
14) “DRIVE” is turned OFF
15) “INP” is turned ON
16) “BUSY” is turned OFF
   The move to the position set in Step No.2 is completed
10.4 Linear interpolation

Move axes in a straight line from the current position at a defined "Speed" (composite speed for the speed of each axis) to a “Position” set in the step data. The speed of each axis is calculated using the formulae below.

There are two types of linear interpolation. LIN-A to specify absolute coordinates and LIN-I to specify relative coordinates. A pushing operation and linear interpolation of Axis 4 cannot be used.

Caution

Setting of the electronic Gear is necessary when actuators with different lead are used. If the electronic Gear is not set, the step data operation may not be performed. Refer to section 3.6 Parameters and Step data for the calculation of the electronic Gear.

Caution

The speed of the actuator may be outside of the specification range depending on the step data. Calculate the speed of each axis before operation, and confirm that the speed is within the minimum and maximum speed specified.
Example) After a Return to origin, move from the origin position at 100mm/s of composite speed to a point at 100mm on Axis 1 and 100mm on Axis 2 (Step No.1).

Then, move from the current position at 50mm/s of composite speed to a point at 100mm on Axis 1 and 50mm on Axis 2 (Step No.2).

</table>
Select Step No.1. (Turn IN0 ON.)

The Motor starts to move to the position set in Step No.1.

Step No.1 is turned ON. (OUT0 is turned ON)

INP is turned OFF.

BUSY is turned ON.

DRIVE is turned OFF.

INP is turned ON.

BUSY is turned OFF.

The move to the position set in Step Data No.1 is completed.

Select Step No.2. (Turn the IN0 OFF, and the IN1 ON.)

Turn the "DRIVE" ON.

Start moving to a point at 100mm on Axis 1 and 50mm on Axis 2.

Step No.2 is turned ON. (OUT1 is turned ON)

INP is turned OFF.

BUSY is turned ON.

DRIVE is turned OFF.

INP is turned ON.

BUSY is turned OFF.

Move to a point at 100mm on Axis 1 and 50mm on Axis 2.
10.5 Circular interpolation

Circular interpolation by specifying the target coordinate (relative) and centre coordinate (relative) referring to Axis 1 as the X axis and Axis 2 as the Y axis. Clockwise circular interpolation is in CIR-R mode and counterclockwise is in CIR-L mode. Each axis travels at a speed lower than the composite speed.

When using circular interpolation the composite speed should be lower than the maximum speed of the actuator and lower than the maximum speed of the other actuators used.

The pushing operation and circular interpolation of Axis 3 and 4 cannot be used.

Set the target position on the arc composed by the current position and centre coordinate.

When the target position does not exist on the arc composed by the current position and centre coordinate, the target position is reached using linear movement on the X or Y axes at the end of the operation (Refer to the Figure below).
### Caution

**Setting of the electronic Gear is necessary when actuators with different a lead are used.**
If the electronic gear is not set, the step data operation may not be produced.
Refer to section 3.6 Parameters and Step data for the calculation of the electronic Gear.

### Caution

When mode CIR-R/L is repeatedly used, there will be an accumulated error in the achieved position due to the motor resolution.
Use the instruction ABS once or twice every 2 or 3 times of using mode CIR-R/L for correcting the positional accuracy.

### Caution

The following are precautions for setting step data.

1) **For circular interpolation** the composite speed used should be lower than the maximum speed of the actuator and lower than the maximum speed of the other actuators used.

2) **Set the target position** on the arc composed by the current position and centre coordinate.

3) **Do not set the rotation centre position** to (0, 0).
Example) After a Return to origin, move from the origin position at 100 mm/s to a point 30mm on Axis 1 and 10mm on Axis 2 (Step No.1).

Move from the current position using counterclockwise circular interpolation movement at 100 mm/s composite speed to a point 0mm on Axis 1 and 40mm on Axis 2 (Step No.2: Centre position 0mm on Axis 1, 20mm on Axis 2).

Make one clockwise rotation movement at 100 mm/s of composite speed (Step No.3: Centre position 0mm on Axis 1, 0mm on Axis 2).

The move to the position set in Step No. 3 is completed.
10.6 Speed tuning control

When an (main) axis is delayed due to external load, the speed of other (slave) axes is controlled. Not the synchronization of the position of the main axis and slave axis. Pushing operation cannot be used.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Actuators with a different lead cannot be used. Use the same type of actuators with the same lead and stroke.</td>
</tr>
<tr>
<td>(2) The minimum speed for speed tuning control is different from the minimum actuator speed. Refer to Supplement 1. Actuator Specifications for the specifications of the actuators.</td>
</tr>
<tr>
<td>(3) When an external force is applied to the slave axis, which is higher than the force applied to the main axis during operation, the speed cannot be tuned for the slave axis. Once the main axis is fixed, the relationship of speed between the main axis and the slave axis is fixed until the completion of the step data operation. Therefore, a new speed cannot be tuned to the new reduced speed of the slave axis.</td>
</tr>
<tr>
<td>(4) Speed is not tuned during deceleration. The timing of deceleration start or level of deceleration depends on the load and operating conditions of the actuators.</td>
</tr>
<tr>
<td>(5) If the external force applied to the main axis is removed during operation, the main axis speed may overshoot. During speed tuning control, the speed of the main axis is controlled so that it is close to the set speed. (The speed of the slave axis is controlled to tune with the actual speed of the main axis) So, if the external force is removed after the condition in which the main axis continues failing to respond to the set speed, the main axis speed may exceed the set speed rapidly due to the accumulated deviation.</td>
</tr>
<tr>
<td>(6) Speed cannot be tuned to the axis whose speed exceeds the set speed due to external force, etc. Speed tuning control works when the actual speed becomes slower than the set speed. So, it does not work when the set speed is exceeded.</td>
</tr>
<tr>
<td>(7) When an external force is applied to multiple axes simultaneously, it is possible that the speed of the slave axis which receives the external force decreases. Even if an external force is applied to multiple axes, only 1 axis is assigned as the main axis. Therefore, the speed of the the slave axes being applied with external force which are not assigned as a main axis may decrease due to accumulated deviation.</td>
</tr>
<tr>
<td>(8) When an external force is applied to the axes unevenly, and the main axis speed exceeds the set speed rapidly, it may take time for the speed of the slave axes to be tuned with the main axis speed. If an external force is applied and the movement delay is generated at an early stage, that axis becomes the main axis. When the main axis overshoots due to the accumulated deviation, other axes try to tune with the main axis within the set speed. Therefore, it takes time for them to be tuned.</td>
</tr>
</tbody>
</table>

Please design and construct the system taking these cautions into consideration.
Example) After returning to origin, move all axes by speed tuning control from the origin to 200 mm point at 100 mm/s. (Step Data No.0 is used for this operation).

</tbody>
</table>

**Operation (Example)**

Speed tuning control starts when a specified speed difference is generated. At this time, due to the speed difference, there is a certain specified deviation in the position of the main axis and slave axes.

The Slave axes operate according to the main axis speed during speed tuning control. This does not nullify the deviation of axes, so the slave axes reach the target position first.
10.7 PLC output signal response time
The PLC output signal response time includes the following factors.
1) Controller signal scan time
2) Delay due to signal analysis
3) Delay due to command analysis
Leave an interval of 40ms or more between signals and maintain the state of the signal for 40ms or more, because PLC processing delays and controller scanning delays could occur.

10.8 Methods of interrupting operation
There are three methods of interrupting the operation and stopping the actuator during a positioning operation or pushing operation, as shown below. The state after the interruption varies, therefore use the method appropriate to the application.

- Stop using the EMG signal
  If the EMG signal is turned OFF during operation, the actuator will decelerate and stop, the servo will turn OFF which means the stopped position is not held. (For an actuator with lock, the position is held by the lock function).
  The residual travel distance will be reset.

- Stop using the RESET signal
  If the RESET signal is turned ON during operation, the actuator will decelerate and stop, and the stopped position is held. (The servo does not turn OFF).
  The residual travel distance will be reset.

- Stop using the HOLD signal
  If the HOLD signal is turned ON during operation, the actuator will decelerate and stop. The actuator will resume travel for the residual distance when the HOLD signal is turned OFF.

⚠️ Caution
If the operation is stopped using the RESET signal, all OUT signals will turn OFF.
11. Operation Instructions

11.1 Outline of the Operation instruction

The controller is possible to operate by selecting the step data in the controller using the EtherNet/IP. Refer to the next section for details of the input/output signal timing and control procedures.

11.2 Operation procedure

Please refer to the following "Procedure" and "Timing chart" for each operation.

(1) From power on to Return to origin

- Procedure -

(a) Turn the power supply ON

(b) The *ALARM turns ON.
   *ESTOP is turned ON.

(c) SVON is turned ON.

(d) SVRE is turned ON.
   INP is turned ON.

   The time taken for SVRE and INP to turn on depends on the actuator type and the operating conditions. (When power is supplied, it may take up to 20 seconds from servo ON to SVRE ON.)

   Actuator (with lock) is unlocked.

(e) Turn SETUP is ON.

(f) BUSY is turned ON and INP is turned OFF (Starts the operation).

(g) Return to origin is completed when the BUSY is turned OFF and SETON and INP turns ON.

- Timing chart -

All valid axes turn on on completion of a return to origin.

The "*ALARM" and "*ESTOP" are expressed as negative-logic circuit.
(2) Positioning operation
- Procedure -

(a) Output the step data No. (INx).

↓

(b) Turn the DRIVE is ON. The step data No. (OUTx) will be input.

↓

(c) The BUSY turns ON and INP turns OFF. (The positioning movement will start.)

↓

(d) When the INP is turned ON and BUSY is turned OFF, the positioning operation is completed.

- Timing chart -

![Timing chart]

The INP signal is ON when all valid axes are within the positioning range after the positioning completion time (theoretical value) has lapsed. The BUSY signal turns OFF when the positioning completion time (theoretical value) has lapsed.

---

**Caution**

Design the system so that no obstacles exist adjacent to the target position which may stop the actuators.

If the actuator is stopped by an obstacle adjacent to the target position during a positioning, the positioning operation will be completed (INP: ON, BUSY: OFF). If an operation instruction follows this, the positional offset from the target position of the previous operation will be reflected in the following operation. However, the offset is possible to be corrected by using the ABS instruction twice or more.
(3) Pushing operation
- Procedure -

(a) Output the step data No. (INx).

↓

(b) Turn the DRIVE ON.
The step data No. (OUTx) will be input.

↓

(c) The BUSY turns ON and INP turns OFF.
(Pushing starts).

↓

(d) The pushing operation is complete when INP is ON and BUSY is OFF. (The force set as the “Pushing Force” in the profile parameter will be generated).

Caution

1) If the movement is interrupted during positioning of the pushing operation, an alarm "(0-149) Failed to achieve set position in set time limit" will be generated.

2) If an operation is instructed after the pushing operation is completed ((d) above), a positional offset will be generated.

Correct the offset by performing the ABS instruction twice or more.
(4) HOLD

- Procedure -

(a) The HOLD is turned ON during a movement operation (when the BUSY is ON).

↓

(b) The BUSY turns OFF. (The actuator will stop).

↓

(c) The HOLD turn OFF.

↓

(d) The BUSY will turn ON. (The Operation will restart)

(5) RESET

[Alarm reset]

- Procedure -

(a) Generation of an alarm

(When the *ALARM is OFF, OUTx corresponding to the alarm group will turn ON).

↓

(b) The RESET is turned ON.

↓

(c) As *ALARM is ON, OUTx is OFF. (The alarm is deactivated).
[Reset of operation]

- Procedure -

(a) The RESET is turned ON during a movement operation (when the BUSY is ON).

↓

(b) The BUSY is OFF and OUTx is OFF. (The actuator will stop).

- Timing chart -

<table>
<thead>
<tr>
<th>Input</th>
<th>INX</th>
<th>DRIVE</th>
<th>RESET</th>
<th>SVON</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The INP signal is ON when the actuators are within +/-“Positioning range” of the target position.
(6) STOP

- Procedure -

(a) The Stop (EMG) input is OFF during an operation (when the BUSY is ON).
   (Stop command)
   ↓
(b) The +ESTOP will turn OFF.
   ↓
(c) The BUSY will turn OFF. (The actuator will stop).
   The SVRE will turn OFF.
   [The actuator (with lock) will be locked.]
   ↓
(d) The stop (EMG) input is turned ON.
   (The stop release command)
   ↓
(e) The +ESTOP will turn ON. SVRE is turned ON.
   [The actuator (with lock) will be unlocked.]

- Timing charge -

*ALARM is displayed in negative logic.
When “Stop (EMG) is 0V” in the timing chart, the stop is activated.
(7) Area output

- Procedures -

(a) Output the Step data No. (INx).

(b) Turn the "DRIVE" ON. Step data No. 1 (OUTx) will be input.

(c) The BUSY will turn ON and INP will turn OFF (the positioning operation will start).

(d) The AREA of step data No. 1 turns ON (at 150mm from the origin point).

(e) The BUSY will turn OFF and INP will turn ON. (Positioning operation of step data No. 1 is completed).

(f) Output the step data No. 2 (INx).

(g) Turn the "DRIVE" ON. Step data No. 2 (OUTx) will be input.

(h) The AREA will turn OFF. The BUSY will turn ON and INP will turn OFF. (The positioning operation will start).

(i) The AREA for step data No. 2 will turn ON (at 170mm from the origin point).

(j) The AREA for step data No. 2 will turn OFF (at 130mm from the origin point).

(k) The BUSY will turn OFF and INP will turn ON. (Positioning operation of step data No. 2 is completed).

- Timing chart -

Initial position: 50mm

↓

Step data No. 1 operation (Position: 200mm, Area 1: 150mm, Area 2: 250mm)

↓

Step data No. 2 operation (Position: 100mm, Area 1: 130mm, Area 2: 170mm)

The INP signal is OFF when the EMG input is OFF. The EMG turns ON (Stop release), and the INP signal turns ON when the actuators are within +/- "Positioning range" of the target position.

| Hard disk space | 50MB or more |
| Interface     | USB port (USB1.1 or USB 2.0) |

Note1) Windows® is the registered trademark of United States Microsoft Corporation.
13. Alarm detection

The details of an alarm generated are possible to check using a PC (with controller setting software). Please refer to the controller setting software manual (No. SFOD-OMT0012) to check the details of the alarms.

When an alarm is generated, deactivate the alarm after troubleshooting and correcting the error with reference to section 13.2 Alarms and countermeasures. Alarms are divided into two types. One alarm type is possible to be cleared by inputting the RESET signal. The other type cannot be cleared unless the main control and motor control power supplies are turned off and on again.

13.1 Alarm group PLC input port signals

When an alarm is generated, the controller outputs signals to distinguish the type of alarm that was set.

Alarms are classified into 4 groups. When an alarm is generated, it is output in signals OUT0 to 3. Refer to the table below for PLC input port signals according to the alarm groups.

<table>
<thead>
<tr>
<th>Alarm group</th>
<th>PLC Input port signals</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>ALARM</strong>       OUT0   OUT1   OUT2   OUT3</td>
</tr>
<tr>
<td>Alarm group B</td>
<td>OFF            OFF   ON     OFF     OFF</td>
</tr>
<tr>
<td>Alarm group C</td>
<td>OFF            OFF   OFF    ON      OFF</td>
</tr>
<tr>
<td>Alarm group D</td>
<td>OFF            OFF   OFF    OFF     ON</td>
</tr>
<tr>
<td>Alarm group E</td>
<td>OFF            OFF   OFF    OFF     OFF</td>
</tr>
</tbody>
</table>

“*ALARM” is displayed in negative logic.

When an alarm is generated, the SVRE or SETON is input according to the contents of the alarm, as shown below.

<table>
<thead>
<tr>
<th>Alarm group</th>
<th>PLC Input port signals</th>
<th>How to start test run.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SVRE        SETON</td>

<td>RESET is ON</td>
</tr>
<tr>
<td>Alarm group E</td>
<td>OFF        OFF</td>
<td>Turn off the main control and motor control power supplies→Turn on again</td>
</tr>
</tbody>
</table>

- Procedure to restart -

1. RESET is ON → SVRE: will automatically turn ON (if SVON is ON when RESET is ON)
2. SETUP is ON → Instruction to restart after a Return to origin is completed.
### 13.2 Alarms and countermeasures

(1) Controller alarm

<table>
<thead>
<tr>
<th>Name of the controller setting software (code)</th>
<th>Group</th>
<th>How to deactivate</th>
<th>Alarms and countermeasures</th>
</tr>
</thead>
</table>
| DRIVE is ON when SVRE is OFF (0-098)          | C     | RESET is ON       | **Details**  
An alarm is generated when the Drive operation [DRIVE] is ON when the servo [SVRE] is OFF after a Return to origin.  
**Countermeasure**  
Command operation while the servo motor is on (SVRE is ON). |
| DRIVE is ON when SETON is OFF (0-099)         | C     | RESET is ON       | **Details**  
An alarm is generated when the drive operation is ON before a return to origin.  
**Countermeasure**  
Start operation after completion of a Return to origin. |
| Failed to achieve set position in set time limit. (0-149) | D     | RESET and SVON is ON | **Details**  
The time to reach the target position is greater than the specified time.  
**Countermeasure**  
Check if the travel of the actuator was interrupted.  
Also, make sure that the load, speed, acceleration and deceleration are within the range of the actuator. |
| Parameter is not registered (0-901)           | E     | Turn off the main control and motor control power supplies. | **Details**  
An alarm is generated when the step data is executed without parameter settings.  
**Countermeasure**  
Download an appropriate parameter to the controller. |
| Step data is not registered (0-902)           | E     | Turn off the main control and motor control power supplies. | **Details**  
An alarm is generated when the step data is executed without step data setting.  
**Countermeasure**  
Download the step data to the controller. |
| System Error (0-910)                          | E     | Turn off the main control and motor control power supplies. | **Details**  
System error occurred. There is a possibility of damage to the controller or a malfunction due to noise.  
**Countermeasure**  
If the alarm is still generated when the power is reapplied, please contact SMC. |
| SDRAM Error (0-911)                           | E     | Turn off the main control and motor control power supplies. | **Details**  
Abnormality concerning SDRAM is confirmed.

| Encoder error (1-192)                         | E     | Turn off the main control and motor control power supplies.                      | < Details >  
An abnormality occurred in communication with the encoder.  
< Countermeasure >  
Check the actuator cable connection. |
| Unable to find motor phase in set time. (1-193) | E     | Turn off the main control and motor control power supplies.                      | < Details >  
Positioning of the polarity is not completed properly. (When the servo motor is turned on (SVON is ON) for the first time after the power is supplied, the actuator needs to move a little to find the motor phase. If this actuator movement is prevented, an alarm will be generated).  
< Countermeasure >  
Make sure there are no obstructions that interfere with the actuator movement and then turn on the servo motor (SVON is ON). |
| Output current limit exceeded set value (1-194) | E     | Turn off the main control and motor control power supplies.                      | < Details >  
The Output current in the power supply circuit is abnormally high.  
< Countermeasure >  
Check if the actuator cable or connector is short-circuited. In addition, make sure that the actuator is compatible with the controller. |
| Current sensor abnormality has occurred. (1-195) | E     | Turn off the main control and motor control power supplies.                      | < Details >  
An abnormality with the current sensors is detected, which is recognized when the controller is initialized.  
< Countermeasure >  
Confirm the combination of the controller and the actuator is correct. If the alarm is still generated when the power is reapplied, please contact SMC. |
| Position error overflowed (1-196)              | E     | Turn off the main control and motor control power supplies.                      | < Details >  
The position deviation counter in the controller has overflowed.  
< Countermeasure >  
Check if the travel of the actuator was interrupted. Also, make sure that the load, speed, acceleration and deceleration are within the specifications of the actuator. |
| Memory abnormality has occurred (1-197)        | E     | Turn off the main control and motor control power supplies.                      | < Details >  
Abnormality concerning EEPROM is confirmed.  
< Countermeasure >  
Please contact SMC. (The write limit of the EEPROM is approximately 100,000 times) |
| CPU error (1-198)                              | E     | Turn off the main control and motor control power supplies.                      | < Details >  
The CPU is not operating correctly. (It is possible that the CPU or surrounding circuits have failed, or the CPU is malfunctioning due to electrical noise).  
< Countermeasure >  
If the alarm is still generated when the power is reapplied, please contact SMC. |
14. Common Precautions for wiring and cable

⚠️ Warning
1. Adjustment, mounting, inspection or wiring should never be carried out before disconnecting the power supply to the product. Electric shock, malfunction and damage can result.
2. Do not disassemble the cable. Use only specified cables.
3. Do not connect or disconnect the cable or connector with the power on.

⚠️ Caution
1. Wire the connector securely. Do not apply any voltage to the terminals other than those specified in the Operation Manual.
2. Wire the connector securely.
   Check for correct connector wiring and polarity.
3. Take appropriate measures against noise.
   Noise in a signal line may cause malfunction. As a countermeasure, high voltage and low voltage cables should be separated, and keep wiring lengths short, etc.
4. Do not route wires or cables together with power or high voltage cables.
   The product may malfunction due to interference and surge voltages. Route the wires of the product separately from power or high voltage cables.
5. Take care that actuator movement does not damage cables.
6. Operate with cables secured. Avoid bending cables at sharp angles where they enter the product.
7. Avoid twisting, folding, rotating or applying an external force to the cable. Also avoid operating at sharp angles.
   Risk of electric shock, broken wires, contact failure and loss of control of the product can occur.
8. Fix the motor cable protruding from the product in place before using.
   The motor cable is not robotic type cable and can be damaged when moved.
   Do not place Part A in the diagram below in a flexible cable duct.

9. Select “Robotic type cables” when deflecting actuator-cables repeatedly. Do not put cables into a flexible moving tube with a radius smaller than the specified value (minimum 50mm).
   Risk of electric shock, wire damage, contact failure and loss of control of the product can occur if “Standard cables” are used in case of deflecting the cables repeatedly.

10. Confirm correct wiring of the product.
    Insulation failure (interference with another circuit, poor insulation between terminals etc.) could introduce excessive voltage or current to the controller or its peripheral devices and damage them.

11. The Speed/ pushing force may vary, depending on the cable length, load and mounting conditions etc.
    If the cable length exceeds 5m, the speed/ pushing force will decrease by a maximum of 10% per 5m.
    (If cable length is 15m: Maximum 20% reduction.)

[Transport]

⚠️ Caution
1. Do not carry or swing the product by the motor or the cable.
15. Electric Actuators / Common Precautions

15.1 Design and Selection

⚠️ Warning

1. Read the Operation Manual before using the product.
   Handling or usage/operation other than that specified in the Operation Manual may lead to breakage and product failure.
   Any damage attributed to use beyond the specifications is not guaranteed.

2. There is a possibility of dangerous sudden action by the product if sliding parts of machinery are twisted due to external forces, etc.
   In such cases, human injury may occur, such as catching hands or feet in the machinery, or damage to the machinery itself may occur. The machinery should be designed to avoid such dangers.

3. A protective cover is recommended to minimize the risk of personal injury.
   If a driven object and moving parts of the product are in close proximity, personal injury may occur. Design the system to avoid contact with the human body.

4. Securely tighten all stationary parts and connected parts so that they will not become loose.
   When the product operates with high frequency or is installed where there is a lot of vibration, ensure that all parts remain secure.

5. Consider a possible loss of power source.
   Take measures to prevent injury and equipment damage in the case of a power supply failure.

6. Consider the behavior of an emergency stop of the whole system.
   Design the system so that human injury and/or damage to machinery and equipment will not be caused, when it is stopped by a safety device for abnormal conditions such as a power outage or a manual emergency stop of the whole system.

7. Consider the action when operation is restarted after an emergency stop or abnormal stop of the whole system.
   Design the system so that human injury or equipment damage will not occur upon restart of operation of the whole system.

8. Prohibition of Disassembly and Modification
   Do not disassemble the product or make any modifications, including additional machining. This may cause human injury and/or an accident.

9. Do not use the controller stop signal, "EMG" as an emergency stop for the system.
   The controller stop signal "EMG" is to be used only for decelerating and stopping the actuator. Design the system with a separate emergency stop circuit which conforms with the relevant safety standards.

10. When using for vertical applications, it is necessary to build in a safety device.
    The rod may fall due to the weight of the work.
    The safety device should not interfere with normal operation of the machine.

⚠️ Caution

1. Use the product for the maximum usable stroke.
   The product will be damaged if it is used with a stroke exceeding the maximum stroke. Refer to the specifications of the product.

2. When the product repeatedly cycles with partial strokes, operate it at a full stroke at least once a day or every 1,000 strokes.
   Otherwise, lubrication can be lost.

3. Do not use the product in applications where excessive external force or impact force is applied.
   The product can be damaged. Components, including the motor, are manufactured to precise tolerances, so the slightest deformation may cause faulty operation or seizure.

4. Return to origin cannot be carried out during operating.

5. Refer to a common auto switch (Best Pneumatics No 2), when an auto switch is built and used within the system.
15.2 Mounting

⚠️ Warning
1. Read and understand the Operation Manual before installing and operating the product.
   Keep the manual in a safe place for future reference.
2. Observe the tightening torque for the mounting screws.
   Tighten screws to the recommended torque for mounting the product.
3. Do not make any alterations to this product.
   Alterations made to this product may lead to a loss of durability and damage to the product, which can
   lead to human injury and damage to other equipment and machinery.
4. When using an external guide, the guide axis should be parallel to the actuator axis.
   There will be damage/excessive wear on the lead screw if the external guide is not parallel.
5. When an external guide is used, connect the moving parts of the actuator and the load in such
   a way that there is no interference at any point within the stroke.
   Do not scratch or dent the sliding parts of the actuator tube or piston rod etc., by striking them with
   other objects. Components are manufactured to precise tolerances, so the slightest deformation may
   cause faulty operation.
6. Prevent the seizure of rotating parts (pins, etc.) by applying lubricating grease.
7. Do not use the product before verifying that the equipment can operate properly.
   After mounting or repair, connect the power supply to the product and perform appropriate functional
   inspections to check it is mounted properly.
8. Cantilever
   When the actuator is operated at high speeds while it is fixed at one end and free at the other end
   (flange type, foot type, double clevis type, direct mount type), a bending moment may act on the
   actuator due to vibration generated at the stroke end, which can damage the actuator. In such a case,
   install a support bracket to suppress the vibration of the actuator body or reduce the speed so that the
   actuator does not vibrate. Use a support bracket also when moving the actuator body or when a long
   stroke actuator is mounted horizontally and fixed at one end.
9. When mounting the actuator or attaching to the work piece, do not apply strong impact or
   large moment.
   If an external force above the allowable moment is applied, it may cause looseness in the guide unit,
   an increase in sliding resistance or other problems.
10. Ensure sufficient space for maintenance activities.
    When installing the products, allow access for maintenance.

15.3 Handling Precautions

⚠️ Warning
1. Do not touch the motor while in operation.
   The surface temperature of the motor can increase to approx. 90 °C to 100 °C due to operating
   conditions. Energizing alone may also cause this temperature increase. Do not touch the motor when
   in operation as it may cause burns.
2. If abnormal heating, smoking or fire, etc., occurs in the product, immediately shut off the
   power supply.
3. Immediately stop operation if abnormal operation noise or vibration occurs.
   If abnormal operation noise or vibration occurs, the product may have been mounted incorrectly.
   Unless operation of the product is stopped for inspection, the product can be seriously damaged.
4. Never touch the rotating part of the motor or moving part of the actuator while in operation.
5. When installing, adjusting, inspecting or performing maintenance on the product, controller
   and related equipment, shut off the power supply to each of them. Then, lock it so that no one
   other than the person can turn the power on, or implement measures such as a safety plug.
6. In the case of the actuator that has a servo motor (24VDC), the “motor phase detection step” is done by inputting the servo on signal just after the controller power is turned on. The “motor phase detection step” moves the table/rod for the distance of one screw-lead maximum. (The motor rotates in the reverse direction if the table hits an obstacle such as the end stop damper.) Take the “motor phase detection step” into consideration for the installation and operation of this actuator.

⚠️ Caution

1. For the controller, set parameters which are appropriate to the connected actuators. Operation with inappropriate parameters may cause failure of the controller or actuator, or damage to the user's systems.

2. Check the product for the following points before operation.
   a) Damage to power supply line and signal line
   b) Looseness of the connector to the power and signal lines
   c) Looseness of the actuator/cylinder and controller/driver mounting
   d) Abnormal operation
   e) Emergency stop of the whole system

3. When more than one person is performing work, decide on the procedures, signals, measures for emergency and how to start the operation after the measures taken. Also, designate a person to supervise work other than those performing work.

4. Actual speed of the product will be changed by the workload. Before selecting a product, check the catalog for the instructions regarding selection and specifications.

5. Do not apply a load, impact or resistance, in addition to a transferred load during the “Return to Origin” operation.
   When performing return to origin by pushing force, additional force will cause displacement of the origin position since it is based on detected motor torque.

6. Do not remove the name plate.

7. An operation test should be carried out using a low speed. Start operation using the predefined speed after confirming there is no problems.

[Grounding]

⚠️ Warning

1. Provide a good earth connection to the actuator.

2. The earth should be a dedicated earth connection. Class D dedicated grounding should be used. (Ground resistance 100Ω or less)

3. The earth cable length should be as short as possible.

[Unpacking]

⚠️ Caution

1. Check that the received product is as ordered.
   If a different product is installed, other than that ordered, injury or damage can result.
15.4 Operating environment

⚠️ Warning

1. Avoid use in the following environments.
   a) Locations where a large amount of dust and cutting chips are airborne.
   b) Locations where the ambient temperature is outside the range of the temperature specification (refer to specifications).
   c) Locations where the ambient humidity is outside the range of the humidity specification (refer to specifications).
   d) Locations where corrosive gas, flammable gas, seawater, water and steam are present.
   e) Locations where strong magnetic or electric fields are generated.
   f) Locations where direct vibration or impact is applied to the product.
   g) Areas that are dusty, or are exposed to splashes of water and oil drops.
   h) Areas exposed to direct sunlight (ultraviolet ray).
   i) Environment at an altitude of 1000 meters or higher.
   Heat dissipation and withstand voltage will decrease. Contact SMC for details.

2. Do not use in an environment where the product is directly exposed to liquid, such as cutting oils.
   If cutting oils, coolant or oil mist contaminates the product, failure or increased sliding resistance can result.

3. Install a protective cover when the product is used in an environment directly exposed to foreign matter such as dust, cutting chips and spatter.
   Play or increased sliding resistance can result.

4. Provide a protective cover if the product is used in direct sunlight.

5. Shield the product if there is a heat source nearby.
   When there is a heat source surrounding the product, the radiated heat from the heat source can increase the temperature of the product beyond the operating temperature range.

6. Grease oil can be reduced due to the external environment and operating conditions. The lubrication performance may deteriorate and shorten the life of the product.

[Storage]

⚠️ Warning

1. Do not store the product with direct contact to rain or water drops. Do not store the product where it is exposed to harmful gases or liquid.

2. Store in an area that is shaded from direct sunlight and has a temperature and humidity within the specified range (-10°C to 60°C and 35 to 85%. No condensation or freezing.)

3. Do not apply vibration or impact to the product during storage.

15.5 Maintenance and Precautions

⚠️ Warning

1. Do not disassemble or repair the product.
   Fire or electric shock can result.

2. Before modifying or checking the wiring, the voltage should be checked with a tester 5 minutes after the power supply is turned off.
   Electric shock can result.
⚠️ Caution

1. Perform maintenance inspection according to the procedure indicated in the Operation Manual.
   Incorrect handling can cause an injury, damage or malfunction of equipment and machinery.

2. Removal of product
   When equipment is serviced, first confirm that measures are in place to prevent dropping of work pieces and run-away of equipment, etc, then cut the power supply to the system. When machinery is restarted, check that operation is normal with actuators in the proper positions.

3. The actuator cable must be removed when manually operating the actuator.
   If the sliding part is moved while the actuator and the controller are connected, the actuator will not move smoothly because the induced voltage of the motor is applied to the controller. An induced voltage may damage the controller when the actuator is used at high frequency.

[Lubrication]

⚠️ Caution

1. The product has been lubricated for life at the manufacturer's and does not require lubrication in service.
   Contact SMC if lubrication is to be applied.

15.6 Precautions for actuator with lock

⚠️ Warning

1. Do not use the lock as a safety lock or a control that requires a locking force.
   The lock used for the product with a lock is designed to prevent dropping of work pieces.

2. When the actuator is mounted in a non-horizontal position, use actuators with lock.
   This may cause damage to the internal parts of the controller. If the actuator is not equipped with a lock, the actuator will move and drop the work piece when the power is removed.

3. "Measures against drops" means preventing a work piece from dropping due to its weight when the product operation is stopped and the power supply is turned off.

4. Do not apply an impact load or strong vibration while the lock is activated.
   If an external impact load or strong vibration is applied to the product, the lock will lose its holding force and damage to the sliding part of the lock or reduced lifetime can result. The same situations will happen when the lock slips due to a force over the thrust of the product, as this accelerates the wear to the lock.

5. Do not apply liquid or oil and grease to the lock or its surrounding.
   If liquid or oil and grease is applied to the sliding part of the lock, its holding force will reduce significantly.

6. Take measures against drop and check that safety is assured before mounting, adjustment and inspection of the product.
   If the lock is released with the product mounted vertically, a work piece can drop due to its weight.

7. When the actuator is operated manually (when SVRE output signal is off), supply 24 VDC to the [LKRLS] terminal of the power supply connector.
   If the product is operated without releasing the lock, wear of the lock sliding surface will be accelerated, causing a reduction in the holding force and the life of the locking mechanism.

8. Do not supply 24VDC constantly to the [LKRLS] terminal.
   Stop supplying supply 24 VDC to the [LKRLS] terminal during normal operation. If power is supplied to the [LKRLS] terminal continuously, the lock will be released, and workpieces may be dropped at stop (EMG).
   For details of wiring please refer to the operation manual for the controller (JXC series).
16. Controller and Peripheral Devices / Specific Product Precautions

16.1 Design and selection

⚠️ Warning

1. Use the specified voltage.
   Otherwise, malfunction and damage to the controller may result.
   If the applied voltage is lower than the specified voltage, it is possible that the load cannot be moved
due to an internal voltage drop. Check the operating voltage before use.

2. Do not operate beyond the specifications.
   Fire, malfunction or actuator damage can result. Check the specifications before use.

3. Install an emergency stop circuit.
   Install an emergency stop outside of the enclosure so that it can stop the system operation
   immediately and intercept the power supply.

4. Establish a back up system such as multiple system of equipment and devices or fail safe
design in advance.

5. If fire or personal injury is expected due to abnormal heat generation, ignition, smoking of the
   product, etc., cut off the power supply for this product and the system immediately.
16.2 Handling Precautions

⚠️ Warning

1. The inside of the controller and its connector should not be touched.
   It may cause an electric shock or damage to the controller.

2. Do not perform operation or setting of this equipment with wet hands.
   It may cause an electric shock.

3. A product that is damaged or missing any components should not be used.
   Electric shock, fire, and injury can result.

4. For the controller, set parameters which are appropriate to the connected actuators.
   Operation with inappropriate parameters may cause failure of the controller or actuator, or damage to
   the user's systems.

5. Be careful not to be caught or hit by the workpiece while the actuator is moving.
   It may cause an injury.

6. Do not connect the power supply to the product until it is confirmed that the workpiece
   movement area is safe.
   The movement of the workpiece may cause an accident.

7. Do not touch the product when it is energized and for some time after power has been
   disconnected, as it can be very hot.
   It may cause burns due to the high temperature.

8. Check for voltage using a tester at least 5 minutes after power-off when performing installation,
   wiring and maintenance.
   Electric shock, fire, and injury can result.

9. Do not use the product in an area where it could be exposed to dust, metallic powder,
   machining chips, or splashes of water, oil or chemicals.
   A failure or malfunction can result.

10. Do not use the product in an area where a magnetic field is generated.
    It will cause failure or malfunction.

11. Do not install the product in an environment where flammable gas, explosive or corrosive gas,
    liquids or other substances are present.
    It could lead to fire, explosion and corrosion.

12. Avoid radiant heat from large heat sources such as direct sunlight or hot furnaces.
    It will cause failure of the controller or its peripheral devices.

13. Do not use the product in an environment subjected to cyclic temperature changes.
    It will cause failure of the controller or its peripheral devices.

14. Do not use in a location where surges are generated.
    When there are units that generate a large amount of surge around the product (for example solenoid
    type lifters, high frequency induction furnaces, motors, etc.), this may cause deterioration or damage
    to the product’s internal circuit. Avoid surge generation and crossed lines.

15. Do not install the product in an environment subjected to vibration and impact.
    It will cause failure or malfunction.

16. If this product is used in conjunction with a relay or solenoid valve, use a type with a surge
    absorbing element built-in.

17. Do not fix multiple axes to the workpiece.
    It may cause injury; or damage to the actuator or the user's system.
16.3 Mounting

⚠️ Warning

1. The controller and its peripheral devices should be installed on a fire-proof material.
   Direct installation on or near a flammable material may cause fire.

2. Do not install this product in a location subject to vibration and impact.
   A failure and malfunction can result.

3. Take measures so that the operating temperature of this controller and its peripheral devices
   are within the range of the specifications.
   Also, this controller should be installed with at least 50mm space between each side of it and
   other structures or components.
   It may cause a malfunction of the controller and its peripheral devices and a fire.

4. Do not mount the controller and its peripheral devices near to a large electromagnetic
   contactor or no-fuse breaker which generates vibration on the same panel. Mount them on
   different panels, or keep the controller and its peripheral devices away from such a vibration
   source.

5. The controller and its peripheral devices should be installed on a flat surface.
   If the mounting surface is distorted or not flat, excessive force may be applied to the housing, etc.
   causing malfunction.

16.4 Wiring

⚠️ Warning

1. Do not damage the cable or apply a heavy object or pinch the cable. Avoid repeatedly bending
   or stretching the cable.
   It may cause an electric shock, fire, or breaking of wire.

2. Wire correctly.
   Incorrect wiring could damage the controller or its peripheral devices depending on the seriousness.

3. Do not perform wiring while the power is on.
   It can damage the controller or its peripheral devices could be damaged, causing malfunction.

4. Do not carry this product by holding its cables.
   It may cause an injury or damage to the product.

5. Do not route wires or cables together with power or high voltage cables.
   The wires to the controller or its peripheral devices can be interrupted with noise or induced surge
   voltage from power lines or high-voltage lines, causing malfunction.
   Route the wires of the product separately from power or high voltage cables.

6. Verify the insulation of wiring.
   Insulation failure (interference with another circuit, poor insulation between terminals etc.) could
   introduce excessive voltage or current to the controller or its peripheral devices and damage them.
16.5 Power supply

⚠️ Caution

1. Use a power supply with low noise between lines and between power and ground. In cases where noise is high, use an isolation transformer.

2. The power supplies for the controller power and the I/O signal power should be separate, and both Power supplies should not be of the “in-rush current limiting type”. If the power supply is “inrush-current control”, a voltage drop may be caused during the acceleration of the actuator.

3. Take appropriate measures to prevent lightning surges. Ground the surge absorber for lightning separately from the ground connection for the controller and its peripheral devices.

16.6 Grounding

⚠️ Warning

1. Ensure that the product is grounded to allow the noise tolerance of the controller. Otherwise it may cause an electric shock or fire.

2. A dedicated Ground connection must be used. Grounding should be to a D-class ground connection. (Ground resistance 100Ω or less)

3. The grounding point should be as near as possible to the controller to keep the cable length short.

4. In the unlikely event that malfunction is caused by the ground connection, it may be disconnected.

16.7 Maintenance

⚠️ Warning

1. Perform maintenance checks periodically. Confirm wiring and screws are not loose. Loose screws or wires may cause unexpected malfunction.

2. Conduct an appropriate functional inspection and test after completing maintenance. In case of any abnormalities (if the actuator does not move, etc.), stop the operation of the system. Otherwise, an unexpected malfunction may occur and it will become impossible to ensure safety. Give an emergency stop instruction to confirm safety.

3. Do not disassemble, modify or repair this controller or the peripheral devices.

4. Do not put anything conductive or flammable inside of the controller. Fire or explosion can result.

5. Do not perform an insulation resistance test or insulation withstand voltage test.

6. Ensure sufficient space for maintenance. Design the system to allow the required space for maintenance.
17. Troubleshooting
Refer to the table below for troubleshooting. When none of the causes in the troubleshooting are possible to be confirmed, it is presumed that the product is faulty and normal operation could only be recovered by the replacement of a part.
It is possible that this product may be damaged due to the operating conditions (applications). Please contact SMC to discuss appropriate measures.
