Operation Manual

PRODUCT NAME

Card Motor Controller
(Pulse input edition)

Model / Series / Product Number
LATCA Series

SMC Corporation
About this operation manual

This operation manual [Card Motor controller (pulse input edition)] summarizes how to handle the Card Motor controller: LATCA-* when it is used in pulse input type.

Refer to [Card Motor controller (step data input edition)] when it is used in step data input type, and refer to [Card Motor controller (serial communication edition)] when serial communication is used.
18.1 Operation errors........................................................................................................... 88
18.2 Position–Speed–Pushing Force errors......................................................................... 91
18.3 Configuration software ................................................................................................. 93
LATCA Series Controller

1. Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "Caution," "Warning" or "Danger." They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)*1, and other safety regulations.

*1) ISO 4414: Pneumatic fluid power -- General rules relating to systems.
ISO 4413: Hydraulic fluid power -- General rules relating to systems.
IEC 60204-1: Safety of machinery -- Electrical equipment of machines.(Part 1: General requirements)

Caution

Caution indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.

Warning

Warning indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

Danger

Danger indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.

<table>

<tr>
<td><strong>1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.</strong></td>
</tr>
<tr>
<td>Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results.</td>
</tr>
<tr>
<td>The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product.</td>
</tr>
<tr>
<td>This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.</td>
</tr>
<tr>
<td><strong>2. Only personnel with appropriate training should operate machinery and equipment.</strong></td>
</tr>
<tr>
<td>The product specified here may become unsafe if handled incorrectly.</td>
</tr>
<tr>
<td>The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.</td>
</tr>
<tr>
<td><strong>3. Do not service or attempt to remove product and machinery/equipment until safety is confirmed.</strong></td>
</tr>
<tr>
<td>1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.</td>
</tr>
<tr>
<td>2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.</td>
</tr>
<tr>
<td>3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.</td>
</tr>
<tr>
<td><strong>4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions.</strong></td>
</tr>
<tr>
<td>1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.</td>
</tr>
<tr>
<td>2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.</td>
</tr>
<tr>
<td>3. An application which could have negative effects on people, property, or animals requiring special safety analysis.</td>
</tr>
<tr>
<td>4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.</td>
</tr>
</tbody>
</table>
1. Safety Instructions

Caution

1. The product is provided for use in manufacturing industries. The product herein described is basically provided for peaceful use in manufacturing industries. If considering using the product in other industries, consult SMC beforehand and exchange specifications or a contract if necessary. If anything is unclear, contact your nearest sales branch.

Limited warranty and Disclaimer/Compliance Requirements

The product used is subject to the following “Limited warranty and Disclaimer” and “Compliance Requirements”. Read and accept them before using the product.

Limited warranty and Disclaimer

1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first. Also, the product may have specified durability, running distance or replacement parts. Please consult your nearest sales branch.

2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided. This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.

3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

- Vacuum pads are excluded from this 1 year warranty. A vacuum pad is a consumable part, so it is warranted for a year after it is delivered. Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to the deterioration of rubber material are not covered by the limited warranty.

Compliance Requirements

1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.

2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.
2 Product Overview

2.1 Features

This controller actuates a connected Card Motor based on parallel I/O signals or pulse train signals from a PLC or similar control device. In addition, the controller outputs signals such as the Card Motor table position and operation complete back to the PLC. Detailed features and functions of this product are listed below.

[Common functions]

(1) Selection of control signal type
The following control signal types can be selected. The dedicated “LATC Configurator” software is adapted to each control signal type.

i. Step data input type
The required Card Motor positions and operation patterns are initially set and stored as “Step Data” in the controller using the configuration software. The controller drives the Card Motor table based on the Step Data. Each Step Data is instigated by parallel input signals determined based on the Step Data number.

ii. Pulse input type
The controller drives the Card Motor controlled by pulse train signals from a PLC or similar control device.

(2) Applicable to all Card Motor models
This controller can be used with all Card Motor models regardless of the encoder resolution or stroke. The parameters of the selected Card Motor are automatically stored in the controller by selecting the appropriate Card Motor model to be connected using the dedicated “LATC Configurator” software.

(3) Encoder signal output
The linear encoder signal, which detects the Card Motor table position, can be output to an external signal reading device. Thus, the table position can be displayed and monitored in real time using an external device.

(4) Workpiece measurement and evaluation using the AREA output function
The size of a workpiece can be measured by driving the Card Motor table using a pushing operation against the workpiece, and the position where the table stopped can be output and displayed.

Workpiece identification and evaluation of a good and bad workpiece is possible using the AREA parallel output signals. The AREA output signal range corresponds to table positions, which can be preset.

(5) Parallel I/O connection and signal status function
The status of the parallel input signals can be checked and the parallel output signals can be manually switched via a PC using the dedicated “LATC Configurator” software. Correct wiring and the function of I/O signals between this controller and a master control device, such as a PLC, can be verified.
[Step data input type]
The following functions can be used in Step Data Input type.

6) Easy configuring of Step Data using Cycle Time Entry Method.
The positioning and pushing operation can be selected. After the target position, positioning
time and pushing force have been set, the positioning and pushing operation can be
performed.

7) 15 Step Data patterns can be configured.
The Card Motor is operated according to the Step Data in the order specified by the parallel
I/O signals.

8) Automatic Return to Origin sequence
The actuator can be returned to the Origin position by sending a single signal to a specified
terminal.

9) Operation with a specified force (Pushing operation)
The pushing force of the Card Motor can be controlled.

[Pulse Input type]
The following functions can be used in Pulse Input mode.

10) Operation by pulse input signals
The table actuates according to the number of pulses, and the speed of movement is
proportional to the pulse frequency.

11) Operation by 3 types of pulse train signals
The controller can be configured to work with the following pulse input signal types by
switching the DIP switches integrated into the controller.
   i. Open collector input (pulse signal power supply voltage 24V)
   ii. Open collector input (pulse signal power supply voltage 5V)
   iii. Differential input (equivalent to line driver 26C31)

12) Operation by 3 types of pulse input methods
The following pulse input control methods can be selected using the dedicated “LATC
Configurator” software.
   i. Pulse and Direction input
   ii. CW and CCW input
   iii. Quadrature input

13) Automatic Return to Origin sequence
The actuator can be returned to the Origin position by sending a single signal to a specified
terminal.

14) Operation with a specified force (Pushing operation)
The pushing force of the Card Motor can be controlled.
By switching the TL input on via the parallel I/O, the actuator moves at 6 mm/s and pushes
the workpiece with the force stored in the Step Data.
Operation by 4 configurable (PID) control parameter patterns.
Four different control parameter patterns can be configured to suit the Load Mass and Thrust Setting values. The actuator performance can be configured by tuning these control parameters according to the specific work load.

[Serial communication]
The following functions are available via the RS485 serial interface.

(16) Multiple controllers can be accessed and controlled via one interface.
A master PLC can communicate with up to 16 devices via the RS485 serial interface.

(17) Configuration of Step Data
The Step Data values can be configured.
(The Step Data values can only be configured when the Card Motor power supply is OFF for safety reasons.)

(18) Step Data operation
The actuator can be commanded to operate according to Step Data stored in the controller.

(19) Direct operation
The actuator can be commanded to operate by setting the target position and positioning time (or target position, speed and acceleration).

(20) Output of the table position
The table position can be output and read externally.

(21) Switching and monitoring of parallel I/O signals
The parallel I/O signals can be switched and the output signals monitored.

⚠️Caution
When the device is set up or when failure occurs, refer to the operation manual of the actuator as well as to this operation manual.
*Keep this operation manual accessible for reference when necessary.
### 2.2 How to order

How to order is shown below.

**LATCA** - **N**

- **Card Motor controller** Note(2)
- **Parallel I/O**
  - N: NPN
  - P: PNP

**X**152

- **Made to Order** Note(3)
- **Option**
  - NIL: Standard product
  - X152: I/O cable (without shield)

- **I/O cable length** Note(3)
  - NIL: Without cable
  - 1: 1 m
  - 3: 3 m
  - 5: 5 m

---

**Notes:**

1) The DIN rail is not included, this must be ordered separately.

2) Step Data Input type or Pulse Input type can be selected using the configuration software.

3) When the I/O cable option is selected, the I/O cable (LATH5-*) with shield is included.

When made to order option (X152) is selected, the I/O cable provided can be changed to (LATH2-*), without shield.
2.3 Structure of the product

An example of the controller structure is shown below.

Note 1) It is possible to specify the controller and the actuator and I/O cables with the Card Motor part number. Only the I/O cable can be specified with the controller part number.

Note 2) It is not possible to order the accessories with the Card Motor part number. Refer to section 15, Option (P.77) and order it separately.

Note 3) PLC, power supply, power supply cables and PCs should be prepared by the user.

Note 4) These items are used to configure and store the actuator and operating parameters and Step Data to the controller, and to perform test operations.

Note 5) These items are used to display and output the table position and active preset positions to external devices via digital outputs when length is measured.

⚠️ Caution

Refer to section 4, External Connection (P.20) for wiring.
Refer to section 17, Controller and Peripheral Devices Specific Precautions (P.83) when handling the wiring and cables.
2.4 Start up procedure
Refer to the following procedure for installation, wiring, setting and operating the controller when the product is to be used for the first time.

(1) Check the contents of the package
Before using this controller, please check the contents supplied are as ordered.

<table>
<thead>
<tr>
<th>Product name</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller (LATCA-*** )</td>
<td>1 pc.</td>
</tr>
<tr>
<td>Power supply plug</td>
<td>1 pc.</td>
</tr>
<tr>
<td>Counter plug</td>
<td>1 pc.</td>
</tr>
</tbody>
</table>

- Separately sold accessories -
Controller configuration kit (Part number: LATC-W2)
[Controller configuration software, communication cable and USB cable are included.]

*If any parts are missing or damaged, please contact your distributor.

(2) Setup of pulse train input signal switch
Setup the pulse train input signal switch installed in the controller so as to correspond to the pulse train input signal to be entered to the controller. Regarding the setup of the pulse input signal switch, refer to section 8. Pulse Input Signal Switch (P. 39).

(3) Mounting the controller
Refer to section 3.4 Mounting (P. 18) for instructions on how to mount the controller.

(4) Wiring and connection
Connect the cables to the controller (CN1 to CN5).
Refer to section 4 External Connections (P. 20) for the wiring of the connectors.
(5) Power supply ON and alarm check
Ensure that the wires are connected correctly and then turn on the 24 VDC power supply.

![Controller LED Status]

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR</td>
<td>Green</td>
<td>Normal</td>
</tr>
<tr>
<td>ALM</td>
<td>Red</td>
<td>Alarm is generated</td>
</tr>
</tbody>
</table>

If the [PWR] LED on the front of the controller is green, the controller is in the normal condition.
If the [ALM] LED on the front of the controller is ON or flashing red, an alarm has been generated.

⚠️ Caution
When an alarm is generated
The type of the alarm can be checked by a combination of the ALARM and POWER LED’s ON or flashing.
Check the type of alarm and remove the cause while referring to section 16. Alarm Detection (P. 80).

(6) Basic parameter setup and Step Data setup
Select the step Data Input type or Pulse Input type with a PC (controller configuration software) and set up the basic settings, such as the Card Motor model to be connected to the controller. In addition, set up the target position and positioning time in the step data for the step data input type, and set up the work load and pushing force set value in the step data for the pulse input type.

* Personal computer (Controller configuration software, Pulse input type)

Refer to section 9. Controller Set Up (P.40) and 14. Card Motor Controller Setting Software (P. 64) for instructions on how to setup.

(7) Test operation
Refer to section 10. Monitor and Test Mode of the Controller (P.46) and 14.5 Monitor/Test window (P. 78) for instructions on operating instruction of test operation

3.3 External dimensions

Controller external dimensions

(1) Direct mounting (LATCA-**)

(2) DIN rail mounting (LATCA-**D)
3.4 Mounting

(1) Mounting

The controller can be direct mounted using screws or mounted on a DIN rail. Details of the controller mounting options are shown below.

- Direct mounting (LATCA-••)
  (Mounting with two M4 screws)

- DIN rail mounting (LATCA-••D)
  (Mounting with DIN rail)

(2) Connection to ground

Place the grounding cable with crimped terminal between the M4 screw and shakeproof washer as shown below and tighten the screw.

Caution

The M4 screw, cable with crimped terminal and shakeproof washer must be prepared by the user. The controller must be connected to Ground to reduce noise.
**Caution**

The earth should be a dedicated earth connection. Use a D-class ground connection (ground with a resistance of less than 100Ω).
The cross sectional area of the grounding cable shall be 2 mm² or more.
The Grounding point should be as near as possible to the controller. Keep the grounding cable as short as possible.

![Diagram](image)

Dedicated grounding --- Good  
Shared grounding --- Not acceptable

(3) Mounting location

Design the size of the control panel and the installation type so that the temperature surrounding the controller is 40°C or less.
Mount the controller vertically on the wall with at least 30 mm (direct mounting) or 50 mm (DIN rail mounting) of space at the top and bottom of the controller as shown below.
Allow 60 mm or more space between the front of the controller and the enclosure cover (lid) for inserting and removing the connectors.

Enough space must be allowed around the controller so that the operating temperature of the controller stays within the specification range.

Avoid mounting the controller near a vibration source, such as a large electromagnetic contactor or circuit fuse breaker on the same panel, or keep it away from the controller.

![Diagram](image)

**Caution**

If the mounting surface for the controller is not flat or is uneven, excessive stress can be applied to the case, which can cause failure. Mount on a flat surface.
4. External Connections

An example of standard wiring of the controller is shown for each connector (CN1 to CN5).

4.1 CN1: Power supply connector

Refer to section 5, CN1: Power supply plug (P.22) for wiring details.

Caution

Do not use an inrush current limited type of power supply for the controller.

4.2 CN2: Motor connector

Connect the controller and the Card Motor using the actuator cable (LATH1-\#).

4.3 CN3: Serial I/O connector

Connect the controller to the PC using the communication cable and USB cable supplied with the controller setting kit (LATC-W2).

When connecting the controller to a PLC, refer to the operation manual [Card Motor controller (Serial communication edition)].
4.4 CN4: Counter connector (option)

Connect the controller to the Multi-counter (CEU5) using the counter cable (LATH3-+).

Refer to section **6.2 Counter plug wiring (P.24)**.

4.5 CN5: Parallel I/O connector

Connect the controller to a PLC using the I/O cable (shielded type LATH5-+ or not shielded type LATH2-+). When using the pulse input method, the use of I/O cable (shielded type LATH5-+) is recommended.

Refer to section **7.4 Parallel I/O signals (P.29)** for details of the parallel I/O signals. Refer to section **7.6 Parallel I/O connector wiring (P.35)** for wiring.

**Caution**

1. Ground both ends of the I/O cable for protection from noise.
2. Ground the cable end at the PLC side with a metal cable clamp so that the entire circumference of I/O cable shield contacts the clamp. Keep the stripped part of shield as short as possible.

![P-clip](image1)

![U-clip](image2)
5. CN1: Power Supply Plug

5.1 Power supply plug specifications
The specifications of the power supply plug supplied with the controller are shown below.

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Function</th>
<th>Functional explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC1 (-)</td>
<td>Power supply (-)</td>
<td>Power supply negative (-) supplied to the controller. The power supply (-) is also supplied to the Card Motor via the internal circuit of the controller and the actuator cable.</td>
</tr>
<tr>
<td>DC1 (+)</td>
<td>Power supply (+)</td>
<td>Power supply positive (+) supplied to the controller. The power supply (+) is also supplied to the Card Motor via the internal circuit of the controller and the actuator cable.</td>
</tr>
</tbody>
</table>

5.2 Electrical wiring specifications
Prepare the Electrical wiring according to the following specifications (to be prepared by the user).

<table>
<thead>
<tr>
<th>Item</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicable wire size</td>
<td>20 AWG / 0.5 mm² Use a single multi-strand wire in each terminal. Strip the ends as shown below and twist the strands together. * The rated temperature of the insulation coating should be 60°C or more.</td>
</tr>
<tr>
<td>Stripped wire length</td>
<td>8mm</td>
</tr>
</tbody>
</table>

⚠️ Caution
Do not connect multiple wires to one terminal.

After wiring the power supply plug, connect it to CN1 power connector of the controller. Refer to section 5.3 Power supply plug wiring (P.23) for wiring.
5.3 Power supply plug wiring

Connect the power supply plug included as an accessory to 24 VDC power supply of the controller and connect it to the power entry of the power supply connector.

- **Open / close lever**
  Press the open / close lever with a dedicated screwdriver and insert the wire into the wire entry.

- **Dedicated screwdriver (Recommended)**
  Phoenix Contact (Product No. SZS0.4X2.0)

---

**Caution**

Use a power supply with a capacity larger than the peak instantaneous power described in the actuator specifications. Do not use a power supply with inrush current limitation for the controller (24 VDC).
6. CN4: Counter Plug

6.1 Counter plug specifications
The specifications for the counter plug supplied with the controller are shown below.

7.3 Parallel I/O circuit (NPN, PNP)
This controller is available with NPN type (LATCA-N) and PNP type (LATCA-P) parallel I/O (The controller is different for NPN type and PNP type).

(1) **Parallel I/O input circuit**
Parallel I/O input circuit is shown below (NPN and PNP common, pulse input is excluded.).

```
(a) IN0<A2> to SVON<A7>
(b) COM<A1>
```

![Parallel I/O input circuit diagram]

**Caution**
If the input signal is not connected (open), the controller may be affected by the surrounding noise, and the circuit in the controller may incorrectly recognize that the input has been activated. Unused terminals should be connected in accordance with the operating conditions.
(2) Parallel I/O output circuit

-NPN type

-PNP type
(3) Pulse train signal input circuit

The pulse signal input can be selected from the open collector input type and differential input type. In addition, the pulse signal voltage can be selected from 24V and 5V in the open collector input type. Open collector input (24V) is set as default as shown below. Change the pulse signal input mode with the pulse signal input switch. When the pulse signal input switch is switched, the value of current control resistance $R$ in the controller is switched.

### i. Open collector input

The setting of pulse train signal input switch should conform to the pulse train signal voltage (see the figure below).

<table>
<thead>
<tr>
<th>Power supply voltage for pulse train signal</th>
<th>Pulse train signal input switch setting</th>
<th>Current limit resistor $R$</th>

</tbody>
</table>

Caution

For differential input, connect the positioning unit using the line driver which is equivalent to DS26C31.

iii. Pulse train signal specifications (Open collector input and differential input are common)

- 24 V
- 21.6 V to 26.4 V
- 5 V
- 4.75 V to 5.25 V

5 μs or more

16 μs or more
### 7.4 Parallel I/O signals (Pulse Input Type)

#### (1) Input side (Pulse input type)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>COM</strong></td>
<td>Common terminal for the input signal power supply. Connect the power supply + side (+ common) or power supply - side (- common) in accordance with the wiring specifications.</td>
</tr>
</tbody>
</table>
| **INO** | Step data Bit No. is assigned (Input using a combination of IN0 to IN1) for the positioning or pushing operation. A change in the step data will be accepted when the following conditions are satisfied:  
   - The BUSY signal is off.  
   - No pulse signal input for 10 ms  
When IN0 and IN1 are turned OFF, the return to origin operation will not be performed, but the step data No. 0 will be used.  
   e.g. (Step data No.2 has been assigned) |
| **IN1** | If the SETUP signal is turned ON while the SVON signal is ON, the Card Motor will automatically return to the Origin Position preset in the controller.  
   **Caution**  
   When the SETUP signal is turned OFF while the Card Motor is returning to origin, the positioning operation will stop immediately. When the SETUP signal is turned ON again, the Card Motor will restart the return to origin operation.  
   When a pulse signal is input while the SETUP signal is turned ON, a return to origin error will occur. |
| **SETUP** | CLR is the deviation reset signal. When the CLR signal is turned ON, the commanded operation (table target value) is overwritten at the table position, and the deviation is cleared.  
   Perform the return to origin position operation after turning the CLR signal OFF.  
   If the pulse input signal is performed without performing a return to origin position, a “return to origin position not executed” error (P.82) will occur.  
   Use the CLR signal when the table needs to be immediately stopped.  
   **Caution**  
   The CLR signal will not operate when the SVON signal is OFF or during a return to origin operation.  
   - The pulse input signal will not be accepted when the CLR signal is ON. |
<table>
<thead>
<tr>
<th>Terminal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TL</strong></td>
<td>When the TL signal is turned ON, pushing operation will start. Refer to 11.3 Pushing Operation (P. 50) for details of the pushing operation.</td>
</tr>
<tr>
<td><strong>SVON</strong></td>
<td>When the SVON signal is ON, the Card Motor is energized. Be sure to perform a return to origin operation after turning ON the SVON signal. If it is necessary to keep the servo motor energized, the SVON signal should remain ON. When the SVON signal is turned OFF, the Card Motor is not energized, therefore the table is not controlled and is free to be moved by external forces. It is possible to clear an alarm (SVON reset) by resetting the SVON signal (ON to OFF to ON).</td>
</tr>
<tr>
<td><strong>NC</strong></td>
<td>Open terminals (not used)</td>
</tr>
<tr>
<td><strong>PP+,-NP+,-NP-</strong></td>
<td>These are the pulse input signals for operation command (table target value). The operation command (table target value) can be obtained by multiplying the sensor resolution by the accumulated value of the number of pulses. The function assignment varies depending on the pulse signal input mode. Refer to &quot;9.3 Basic Parameter Setup (P. 41) &quot; for details. Sensor resolution LAT3---30 μm LAT3F---1.25 μm Note) A Pulse input signal should be input earliest after 10 ms or more after changing the IN0, IN1 setting.</td>
</tr>
</tbody>
</table>

Caution

If a large number of pulse input signals is input and the Target Position of the table is outside the stroke range, the table will stop at the stroke end. Following this, by inputting pulse input signals in the opposite direction, the table is positioned at the Target Position after that the Target Position is within the stroke range.
(2) Output side (Step Data input type)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC2(+)</td>
<td>Connect the 24 V terminal of the power supply (24 VDC) for the input/output signals.</td>
</tr>
<tr>
<td>DC2(-)</td>
<td>Connect the 0 V terminal of the power supply (24 VDC) for the input/output signals.</td>
</tr>
</tbody>
</table>

**BUSY**

The BUSY output signal will be ON when the Card Motor is moving (during the Return to Origin, positioning and pushing operations).

The function of the BUSY output signal can be changed, or the BUSY function can also be assigned to other outputs in the "I/O Setup" window in the controller configuration software.

**Caution**

If the Card Motor is stopped during the pushing operation (no movement but the actuator is generating a pushing thrust), the BUSY signal will be OFF.

Also, if the Card Motor operates at a speed slower than 5 mm/s, the BUSY signal may not turn ON at all.

**ALARM**

ON when there are no alarms.

OFF in alarm condition.

The function of the OUT0 and OUT1 output signals can be changed to the functions listed below in the controller configuration software "I/O Setup" window.

The INP signal function is set as a default for OUT0, and INF for OUT1.

- **INP signal**
  - Operation completion signal
  - During the return to origin
    - The INP output turns ON after the return to origin operation is completed.
  - During positioning operation
    - When the pulse input signal is input, the OUT0 and OUT1 signals turn off. If the pulse input signal is not input for 10 ms after the Card Motor moves near to the target value, the output will turn ON.
  - During pushing operation
    - The INP signal will turn OFF during the pushing operation.

**Caution**

If the Target Position of the table is outside the stroke range, the table will stop at the stroke end, but the INP signal will not be turned ON.

- **INF signal**
  - The INF output turns ON when the pushing force generated has exceeded the set "Threshold Force Value" after the TL signal is input and the pushing operation has started.
  - When the TL signal is turned OFF, the INF signal also turns OFF.
  - The "Threshold Force Value" can be set in the controller configuration software "I/O Setup" window.

**Caution**

The "Threshold Force Value" is set in the "I/O Setup" window as a general value for all pushing operation Step Data, but the "Thrust Setting Value" can be set individually for each Step Data.

Therefore the INF output may be activated when the pushing force differs from the set "Thrust Setting Value".
- INFP signal
  The output turns ON when the current Card Motor table position is within the positioning repeatability range (LAT3 is 0.09 mm, LAT3F is 0.005 mm) of the target position. The output conditions for each operation mode are similar to those for the INP signal.

- AREA signal
  The output turns ON when the actuator is within the output range between "Position 1" and "Position 2".
  
  The range for "Position 1" to "Position 2" can be set in the controller configuration software "I/O Setup" window.
  
  A maximum of two position ranges, “AREA A” and “AREA B”, can be selected for the AREA output signal, and the range from "Position 1" to "Position 2" can be set individually for each of them.

  It is possible to set only one signal function per output for OUT0 and OUT1.
  
  (e.g. OUT0 = INP, OUT1 = AREA A)

Example of AREA signal output

<table>
<thead>
<tr>
<th>Table position</th>
<th>Status of the parallel I/O signals</th>
</tr>
</thead>
<tbody>
<tr>
<td>AREA B (Position 2)</td>
<td>ON</td>
</tr>
<tr>
<td>AREA B (Position 1)</td>
<td>OFF</td>
</tr>
<tr>
<td>AREA A (Position 2)</td>
<td>OFF</td>
</tr>
<tr>
<td>AREA A (Position 1)</td>
<td>ON</td>
</tr>
</tbody>
</table>

NC Open terminals (not used)

⚠️ Caution

The Card Motor table is held in position and the position is read by the controller during the interval after the SVON signal has been activated and before the operation has started by turning the SVON signal ON (Positioning control).

No signal output control is carried out while the table position is being held, so the output signal status is maintained when the DRIVE signal is OFF.

Only the INF signal will turn OFF when the DRIVE signal is turned OFF.

The step data is executed according to the input signal status of IN0 to IN3 as soon as the DRIVE signal has changed from OFF to ON (operation starts on the rising edge).

Ensure that the power supply has been turned ON and that the ALARM signal is ON before activating any input signals.

If input signals are ON before that, a "return to origin position not executed" error will occur. Turn ON the input signal again after turning OFF SVON signal.

Furthermore ensure the same I/O signal sequence, and turn OFF and ON again all input signals, when operating the Card Motor with parallel I/O signals, after communicating with the controller configuration software.
### Input/Output table (Step Data input type)

</tr>
</tbody>
</table>

Note 1) When using the step data input method, do not wire to the terminals B7 to B10. These input terminals incorporate an internal circuit for pulse input signal, so this may lead to failure.

Note 2) If step data entry type is selected for the controller input type, the function of the terminals will be...
different from those in the table above. If the controller is used with the step data input type, refer to the operation manual [Card Motor Controller (Step Data Input version)].

7.6 Parallel I/O connector wiring (example)

Use an I/O cable (LATH2-* or LATH5-*) for connecting the controller CN5 parallel I/O connector to a PLC. The wiring depends on the parallel input/output of the controller (NPN, PNP type). Wire the product while referring to the wiring diagram below.

(1) NPN type

(2) PNP type

Note 1) When the step data input method is used, do not connect wires to the terminals B7 to B10. Internal circuits are included which are used as pulse input signal terminals.

Caution

Prepare 2 separate 24 VDC power supplies for the CN1 controller power supply and CN5 input/output signal power supply.
### (3) Pulse input internal circuit

⚠️ Caution

When using the pulse input signal method, make sure to change the pulse input signal switch inside the controller to the correct state to select the required current limiting resistance.
8. Details of Pulse Input Signal Switch

Set the Pulse Input Switch inside the controller in accordance with the pulse input signal method being used.

8.1 Setting of Pulse Input Signal Switch

8.2 Changing the Pulse Input Signal Switch

(1) Remove the controller housing.
(2) Switch the pulse input signal switches on the PCB.
   Set the switch positions in accordance with the pulse input signal.
(3) Operate the switches:
   - with a load not more than 9.8 N.
   - Apply a load to the switches only in the horizontal direction. Do not apply load from the top or in the diagonal direction.
   - Use a suitable small screwdriver to operate the switches.

![Diagram of Pulse Input Signal Switches]

(a) Open collector input (24 V)  
(b) Open collector input (5 V)  
(c) Differential input

**Caution**

When handling the controller with the housing removed, observe precautions against static electricity and ensure operators are connected to ground using a wrist strap, etc. When removing/connecting the connectors, make sure that the power supply is OFF in advance.
9. Controller Set Up

Before the controller can be operated in order to move the Card Motor to a specified position, it is necessary to program the items shown below in the controller using a PC with the controller configuration software installed. The data entered using the controller configuration software will be stored in the memory of the controller.

9.1 Searching/connecting of the controller

Initially the configuration software will search the ID of the controller connected to the serial communication port (RS-485), and then communicates with the controller with the ID that is selected.

Search and Selection of Controller ID

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Search</td>
<td>Specifies the ID range for searching Note 1), and searches for the connected controller ID within the specified range.</td>
</tr>
<tr>
<td>Connect</td>
<td>Starts communication with the controller of the selected controller ID.</td>
</tr>
</tbody>
</table>

Note 1) Specify the controller ID search range to find the controller connected to the PC. (Default searching range: 1 to 1)

* If the search range is large, this may take several minutes for searching.

9.2 Selection of the input type

Select the controller input type from "Step Data Input type" or "Pulse Input type" in accordance with the host PLC.

The Input type can be changed by initializing the controller. However, initialization resets all of the settings, so the settings will be required again. (Refer to 14.6 Confirmation of the version and initialization (P. 76))

<td>The angle of the Card Motor connector is 0 to 45° to the vertical surface.</td>
</tr>
<tr>
<td>Vertical</td>
<td>The angle of the Card Motor connector is 46 to 90° to the vertical surface.</td>
</tr>
</tbody>
</table>

### Setup

The changed value is sent to the controller connected to the PC.

**Caution**

To complete the setting, execute the controller reset operation before operating the Card Motor. A message will appear in the controller configuration software window instructing the user to perform a reset operation.

### Comm (Communication)

If the communication is interrupted whilst the controller configuration software is running, the communication can be restored by clicking the [Comm] button. However, the communication cannot be completely restored unless the cause of the communication disconnection is solved.
9.4 Movement Profile Recommended for Pulse Input Type

There is a movement profile recommended for operation of the Card Motor in pulse input mode.

(1) Positioning time

Use the positioning time of the Card Motor according to the graphs shown below as reference for designing a circuit for pulse input mode.

LAT3• Relationship between positioning time and total travel distance

LAT3F• Relationship between positioning time and total travel distance

(2) Recommended movement profile

To obtain the total travel distance $S$ [mm] in absolute positioning mode, calculate the difference between the position from which the table travel starts to the target position. The table will move to the Target Position according to a trapezoidal movement profile as shown in the diagram on the right, based on the set speed $V_c$ [mm/s], acceleration $A_a$ [mm/s²] and deceleration $A_d$ [mm/s²].

Refer to the equations below for the acceleration time, constant velocity time and travel distance.

Acceleration time: $t_a = \frac{V_c}{A_a}$ [s]
Deceleration time: $t_d = \frac{V_c}{A_d}$ [s]
Acceleration distance: $S_a = 0.5 \times A_a \times t_a^2$ [mm]
Deceleration distance: $S_d = 0.5 \times A_d \times t_a^2$ [mm]
Travel distance with constant velocity: $S_c = S - S_a - S_d$ [mm]
Travel time with constant velocity: $t_c = \frac{S_c}{V_c}$ [s]
Positioning time: $t_p = t_a + t_c + t_d$ [s]
(Add settling time to the Positioning time to get the total positioning time).

The acceleration and deceleration should be set lower than the maximum acceleration / deceleration in relation to the load mass during operation as shown in the figure on the right.
## 9.5 I/O setup

Settings for parallel I/O signals:

Set the load mass in Step data No.0 when the Card Motor is jogged with a load mounted.</td>
</tr>
</tbody>
</table>

⚠️ Caution

The thrust setting value is a nominal value, therefore calibrate the thrust setting value according to the application and check the operation sufficiently when setting and before using the Card Motor and controller.

⚠️ Caution

The selected load mass is a guideline only, therefore be sure to check the operation sufficiently when setting and before using the Card Motor and controller.
In the "Monitor / Test" window the Card Motor status can be monitored and the performance tested. Monitor mode: The Card Motor status can be monitored from a PC when the Card Motor is operated by pulse inputs from the PLC. After selecting the Monitor Mode, execute the return to origin operation, using the parallel I/O signals, before operating the Card Motor in Monitor Mode. Test mode: A test operation can be performed by controlling the Card Motor from the connected PC. the following two operation modes [Jogging] and [Inching] can be performed in test mode.

<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Start</td>
<td>Starts the selected step data operation.</td>
</tr>
</tbody>
</table>

⚠️ **Caution**  
For LAT3F, the set value will be rounded off to the nearest decimal of the positioning resolution of 0.00125 mm.

⚠️ **Caution**  
Check the operation by testing sufficiently before using the product.  
Terminate other programs running on the PC before starting a test operation.  
Some functions of other software running simultaneously on the PC, may cause the CPU of the PC to overload during communication between the controller and the PC, which may cause the Card Motor to malfunction and not operate according to the settings.  
Terminate other applications before operating the Card Motor controller.
11. Operation

11.1 Return to origin position

The Card Motor uses an incremental type sensor (linear encoder) to detect the table position. Therefore, it is necessary to return the table to the origin position after the power supply has been turned onto set the origin position.

There are three [Return to origin position] methods as described below. In any of the methods, the origin position (0) will be set in the controller at the connector end. When the table moves toward the opposite end, after the [Return to origin] operation, the position of the table registered in the controller will be added (incremental positive direction).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retracted End Position (Connector end)</td>
<td>The table moves towards the connector end until it is stopped by the</td>
</tr>
<tr>
<td></td>

<td>a certain distance (J) from that position towards the connector end.</td>
</tr>
<tr>
<td></td>
<td>After [Return to Origin Position] is completed, the table stops at the sensor</td>
</tr>
<tr>
<td></td>
<td>Origin position. This method is used to achieve high repeatability of the</td>
</tr>
<tr>
<td></td>
<td>Origin position. This [Return to Origin Position] method applies only to LAT3F-* card motors, which are equipped with [Origin Position signal] in the sensor.</td>
</tr>
</tbody>
</table>

The figure below shows the stopping positions for each [Return to Origin Method].
Return to Origin position reference example

[Return to Origin position] command → Travels in the set Origin position direction →
Stops travelling → Reverse travel → Sets the Origin position

* The controller uses the “Load Mass” value set in “Step Data No.0” for the “Return to Origin” operation. Therefore confirm that the “Load Mass” value for “Step Data No. 0” corresponds to the applied load for the “Return to Origin” operation.

⚠️ Caution

The movement direction of the [Return to Origin Position] operation varies depending on the [Return to Origin Position] method used.
The Origin position varies depending on the [Return to Origin Position] method used.
Set the operating conditions according to the requirements of the actual application.
Only with the LAT3F series, it is possible to return to the Sensor Origin.
The Sensor Origin position varies depending on the stroke.
Refer to the Card Motor specifications for details.
If the Return to origin Position is performed using an external jig or work piece to stop the table, the target positions must not be set outside of the Card Motor travel range.
Do not set the target position in the step data outside of the Card Motor travel range. This may damage the work piece and the Card Motor.
11.2 Positioning operation

The table moves to the position according to the pulse input signals. When no pulse input signals are received, the table maintains its position.

-Positioning Operation (Example)

<table>
<thead>
<tr>
<th>Table</th>
<th>Guide rail</th>
<th>Home position</th>
<th>Target position</th>
</tr>
</thead>
</table>

*Moves to the target position with speed and acceleration according to the pulse input signals.

-Movement profile for positioning operation [Speed/Position] (Example)

![](speed_profile.png)

Caution

The travel distance, speed and acceleration/deceleration commands from the positioning unit must not exceed the specifications of the actuator. Operation exceeding the specifications could lead to an alarm and/or malfunction.

After changing IN0 and IN1 signals, wait at least 10 ms before inputting pulse input signals.

The Card Motor does not perform the positioning operation when the travel distance is shorter than the following values.
Enter pulse input signals greater than the counts shown below.

- LAT3-*: 3 counts
- LAT3F-*: 4 counts

11.3. Pushing operation

When the following conditions are met, operation is switched to the pushing operation.

1) Return to Origin operation has been completed.
2) Pulse input signals with a target position ahead of the workpiece to be pushed have been entered. By turning the TL signal ON while the table is moving with the pulse input signals entered will keep moving the table at the pushing speed of 6 mm/s. (When the pulse input signals are 6 mm/s or less, the speed will be the same as the pulse input signals.)

Once the controller has recognized that the table has reached the workpiece, the table pushes the workpiece with the pushing force Note 1) set in the "Step Data" [Thrust Setting Value]. Four [Thrust Setting Value] levels can be configured in the “Step Data Setup” window and the Step Data can be selected by the IN0 and IN1 signals.

3) The TL signal has been turned ON.

In a pushing operation, the INF signal turns ON when a current equal to or higher than the "Threshold Force Value" current set in the controller is applied. When the TL signal is turned OFF, the INF signal will also turn OFF and the position will be held.

Note1) The set pushing force [Thrust Setting Value] must be adjusted by the user as required.

The pushing force varies depending on the operating environment, pushing direction and table position.

The pushing force [Thrust Setting Value] set in the Step Data is a nominal value only.

Note2) When the TL signal is ON, the table will stop when it reaches the stroke end, or when the pulse signal input stops.
(1) Successful pushing operation
The table will keep pushing the workpiece after reaching the workpiece.

- Pushing operation (Example)

(2) When the workpiece moves
(i) The workpiece moves in the pushing direction.
If the reaction force from the workpiece becomes smaller and the actuator moves with a force smaller than that specified in the [Step data] - [Thrust setting value] after the table has reached the workpiece, it continues pushing the workpiece until the specified pushing force is generated.

(ii) If the workpiece moves in the opposite direction to the pushing force (If it is returned due to a large reaction force from the work piece) or if the reaction force from the work piece becomes larger and the actuator is pushed back after the table has reached the work piece, it continues to be pushed back until the reaction force and pushing force are balanced (The actuator is pushed back in the pushing start direction).

(3) Return from pushing operation to positioning operation
To return from the pushing operation to the positioning operation, follow the instructions given below:
   i. Turn the TL input OFF.
   ii. Input pulse signals in the opposite direction to the pushing operation direction.
When the Card Motor’s current table position equals the target position input by the pulse signal, the Card Motor transitions from the pushing operation to positioning operation.
11.4 Response time for the controller input signals

The controller input signal response delay, other than pulse input signals, includes the following factors:

(1) Controller input signal scan delay
(2) Delay due to input signal analysis
(3) Delay of command analysis

Both the PLC and the controller processing cause delays. Ensure an interval of 2 msec or more is allowed between input signals, and maintain the signal state for at least 2 msec.

Time the input signal conditions according to the response output signals.

11.5 Methods of interrupting operation

There are two methods of interrupting the operation and stopping the actuator during both positioning operation and pushing operation, as shown below.

The state after stopping is different, therefore use the method appropriate to the application.

- Stopped using the CLR signal
  Turning the CLR signal ON during operation will clear the position deviation and will stop the table with the pulse input rejected, and will maintain the table position where the table stops. Perform the Return to Origin Position operation after turning the CLR signal OFF. If the pulse input signal is entered without performing the Return to Origin Position, a "Return to Origin Position not executed" error (P.81) will occur.

- Stopped by the SVON signal
  If the SVON signal is turned OFF during operation, the power supplied to the actuator is cut off and the table will move freely.

⚠️ Warning

Consider possible unexpected movements of the Card Motor in the event of an emergency stop, alarm or power failure.

The table will not be held in place and may be moved by external forces if the power supply to the Card Motor is switched off due to an emergency stop or if the SVON signal is turned OFF, in the event of an alarm (when the temperature of the Card Motor exceeds 70°C) or at power failure. If the Card Motor is mounted vertically or at an angle, the table will drop.

Design the Card Motor application to avoid injury and equipment damage caused by unexpected table movements.

⚠️ Caution

Do not impact the stroke ends with the work piece in operations other than return to origin position or at speeds higher than the specified pushing speed during pushing operation.

The Card Motor is equipped with a stopper to prevent the table from coming off and to take light impacts generated when returning to the origin position and when transferring work pieces within the specified limits. Excessive external force or impact may damage the Card Motor.

Install a separate external stopper if the operating conditions require.
For pushing operations, set the target position at least 1 mm away from the position where the table or the pushing tool comes into contact with the work piece. Otherwise, the table may hit the work piece at a speed in excess of the specified 6 mm/s pushing speed, which could damage the work piece and the Card Motor.

**The Card Motor must not overheat.**

The temperature rise of the Card Motor depends on the ambient conditions and operation. Take the following countermeasures if the temperature of the Card Motor rises high enough to generate a temperature alarm:
- Reduce the Thrust Setting Value.
- Reduce the duty ratio by increasing the cycle time.
- Improve the heat transfer properties of the mounting base and the surroundings.
(Refer to section 16. Alarm Detection” (P.80) for further details).

**Remove any obstacles within the Card Motor travel range.**

The obstacles will interfere with the Card Motor, resulting in damage to the Card Motor. Interference with obstacles may cause overcurrent to the Card Motor, which may cause overheating.

Ensure that there are no obstacles before starting operation.

**The thrust force generated by the Card Motor varies in relation to the "Thrust Setting Value", depending on the table position, pushing direction and operating environment.**

The “Thrust Setting Value” in the step data is a nominal value. Therefore, calibrate the “Thrust Setting Value” according to the application under real conditions.

**If instructed to stop by the SVON signal, the BUSY signal will turn OFF and the OUT0 and OUT1 signals will be active or turn ON/OFF as follows.**

If the AREA A and AREA B functions have been assigned to OUT0 and OUT1 then they will continue to turn ON/OFF depending on the AREA A and AREA B position range settings in relation to the table position.

If any other function has been assigned to OUT0 and OUT1 they will turn OFF.
12 Operation Examples and Procedures

12.1 Return to origin example

Example: After power has been supplied, the table is returned to origin from its initial position 5 mm away from the retracted end without load.

- Basic setting example

**Return to origin method**

Origin at the retracted end

**Origin at the retracted end**

(Example)

Table

Guide rail

0 mm

5 mm

Origin
12.2 Positioning operation example

Example:
Step 1: The table of LAT3-10 has to move to absolute position 9 mm (target position 1) from the retracted end within 0.2 seconds without a load.
Step 2: The table has to move from absolute position 9 mm from the retracted end (target position 1) to absolute position 3 mm from the retracted end (target position 2) within 0.15 seconds.

i. Setting example of pulse input signals
Card Motor encoder resolution: 30 μm/pulse
2-pulse input mode:
- Target position 1: Travel distance 9 mm, Travel speed 20 mm/s, Acceleration 80 mm/s², Deceleration 80 mm/s²
- Target position 2: Travel distance 5 mm, Travel speed 20 mm/s, Acceleration 80 mm/s², Deceleration 80 mm/s²

ii. Calculation example
Travel distance [Number of pulses (pulse)] = Travel distance (mm) ÷ Encoder resolution (μm/pulse)
Travel speed [Pulse frequency (pulse/s)] = Travel speed (mm/s) ÷ Encoder resolution (μm/pulse)
Acceleration and Deceleration time [s] = Travel speed (mm/s) / Deceleration (or acceleration) (mm/s²)

[Calculation example: Target position 1]
Travel distance: 9 ÷ (30 × 10⁻³) = 300 [pulses]
Travel speed: 60 ÷ (30 × 10⁻³) = 2000 [pulses/s]
Acceleration time: 60 ÷ 1500 = 40 [ms]
Deceleration time: 60 ÷ 1000 = 60 [ms]

[Calculation example: Target position 2]
Travel distance: 6 ÷ (30 × 10⁻⁶) = 200 [pulses] (in the reverse direction)
Travel speed: 60 ÷ (30 × 10⁻³) = 2000 [pulses/s]
Acceleration time: 60 ÷ 1500 = 40 [ms]
Deceleration time: 60 ÷ 1000 = 60 [ms]
### Step Data setting example

<table>
<thead>
<tr>
<th>No.</th>
<th>Thrust setting value</th>
<th>Load mass (g)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

1. Turn the "SVON" input ON and return the table to Origin. (The motor is energized.)
2. Select/input Step No.0: Turn the "IN0" input ON, and the "IN1" input OFF.
3. Enter pulse input signals.
   - Number of pulses: 300 pulses
   - Pulse frequency: 2000 pulses/sec
   - Acceleration time: 40 ms
   - Deceleration time: 60 ms
   - The table starts traveling to target position 1.
4. The "OUT0" (INP) output turns OFF.
5. The "BUSY" output turns ON.
6. When the traveling is completed, "OUT0" (INP) output turns ON.
7. The "BUSY" output turns OFF.
8. Traveling to target position 1 is completed.
9. Enter pulse input signals.
   - Number of pulses: 200 pulses
   - Pulse frequency: 2000 pulses/sec
   - Acceleration time: 40 ms
   - Deceleration time: 60 ms
   - The table starts traveling to target position 2.
10. "OUT0" (INP) output turns OFF.
11. "BUSY" output turns ON.
12. When the traveling is completed, "OUT0" (INP) output turns ON.
13. "BUSY" output turns OFF.
14. Traveling to target position 2 is completed.

* Keep SVON signal ON.
(Refer to 7.4 Details of Parallel Input/Output Signals (P. 29) for more details)
12.3 Pushing operation example

Example: The table travels to the position 9 mm from the origin within 1 second with a 500 grams load, and starts pushing the workpiece at the position of 9 mm from the origin.

The table decelerates to 6 mm/s when the TL signal is turned ON while moving, and it begins to perform pushing operation with the set pushing force when it reaches the workpiece.

i. Setting example of pulse input signals
Card Motor encoder resolution: 1.25 μm
2-pulse input method:
Target position 1: Travel distance 5 mm, Travel speed 20 mm/s, Acceleration 80 mm/s², Deceleration 80 mm/s²
* Set a travel distance approximately 1 mm past the workpiece position. (However if the travel distance is too long, returning will take longer as the Card Motor has to catch up deviant pulses.)

ii. Calculation example
Travel distance [Number of pulses (pulse)] = Travel distance (mm) ÷ Encoder resolution (μm/pulse) Travel speed [Pulse frequency (pulse/s)] = Travel speed (mm/s) ÷ Encoder resolution (μm/pulse) Acceleration and Deceleration time [s] = Travel speed (mm/s) ÷ Deceleration (or acceleration) (mm/s ²)

[Calculation example: Target position]
Travel distance: 10 ÷ (1.25 × 10⁻³) = 8000 [ pulses] 
Travel speed: 12 ÷ (1.25 × 10⁻³) = 9600 [ pulses/s] 
Acceleration time: 12 ÷ 120 = 100 [ ms] 
Deceleration time: 12 ÷ 60 = 200 [ ms]

**Caution**

Input the TL signal after reducing the speed sufficiently.

Inputting the TL signal before reducing the speed may cause vibration.
**12.4 Operation after Pushing Operation**

Example: Continuing from the operation example in section "12.3 Pushing Operation", the table moves to the target position 2, which is 4 mm from the Origin position, within 0.5 seconds.

i. Setting example of pulse input signals
   Card Motor encoder resolution: 1.25 μm/pulse
   2-pulse input method:
   Target position 2: Travel distance 5 mm, Travel speed 20 mm/s,
   Acceleration 80 mm/s², Deceleration 80 mm/s²

ii. Calculation example
   Travel distance [Number of pulses (pulse)] = Travel distance (mm) ÷ Encoder resolution (μm/pulse)
   Travel speed [Pulse frequency (pulse/s)] = Travel speed (mm/s) ÷ Encoder resolution (μm/pulse)
   Acceleration and Deceleration time [s] = Travel speed (mm/s) / Deceleration (or acceleration) (mm/s²)

   **[Calculation example: Target position]**
   Travel distance: \( \frac{5}{1.25 \times 10^{-3}} = 4000 \) [pulses]
   Travel speed: \( \frac{20}{1.25 \times 10^{-3}} = 16000 \) [pulses/s]
   Acceleration time: \( \frac{20}{80} = 250 \) [ms]
   Deceleration time: \( \frac{20}{80} = 250 \) [ms]

---

**Controller Parallel input / output signals**

</tbody>
</table>

---

**Flow chart (Reference)**

1. Turn "TL" signal OFF;
   The table keeps pushing.
2. Input pulse input signals.
   Number of pulses: 4000 pulses,
   Pulse frequency: 16000 pulses/sec,
   Acceleration time: 250 ms, Deceleration time: 250 ms
3. "OUT1" (INF) signal turns OFF;
4. "BUSY" signal turns ON;
5. When the table moves to the position 6 mm from the origin, "OUT0" (AREA A) output turns OFF.
6. When the traveling is completed, "INP" signal turns ON.
7. "BUSY" output turns OFF;
7. "BUSY" signal turns OFF;
   Pushing operation completed.

* By selecting INP signal for "BUSY" output, INP signal can be output.
13. Operation Instructions

13.1 Overview of the operation instructions
Load mass and pushing force are preset in the Step Data, and the Step Data is assigned using the parallel I/O signals.
The Card Motor is operated by sending input pulses to the controller.
Switch to Monitor Mode or terminate the Controller Setting Software to use parallel I/O signals for controlling the Card Motor.
To avoid accidents any active parallel I/O signals are ignored when the Controller Setting Software is started (except when it is in Monitor Mode) or when the power to the controller is turned on.

13.2 Parallel I/O operation procedures
Refer to the following “Procedures” and “Timing charts” for details of the Return to Origin, operation mode procedures and the signal timing.

(1) Power on and return to origin position
- Procedure -
i. Switch the power supply on.
↓
ii. The “ALARM” output turns ON.
↓
iii. Turn the “SVON” input ON.
↓
iv. Turn SETUP input ON.
Step Data No. (IN0, IN1) are read by the controller.
Return to origin starts.
The BUSY output turns ON.
↓
v. When the “OUT0” (INP) output turns ON and the “BUSY” output turns OFF, the Return to Origin position operation has been completed.

Caution
The controller will be initializing after the power supply has been turned on, until the ALARM output has turned ON. Ensure that no operation command input signals are activated before the ALARM output has turned ON.
Pulse input signals should not be input before the SETUP signal has been turned OFF. Pulse input signals input while the SETUP signal is ON are discarded.
(2) Positioning operation

- Procedure -

i. Select the Step Data No. by inputs (IN0, IN1).

ii. Send the pulse input signals.
(The controller reads Step Data No. (IN0, IN1), and the positioning movement starts.)

iii. OUT0 (INP) output is turned OFF.

iv. When the Card Motor starts the operation, the BUSY output turns ON.

v. When the Card Motor operation is reduced to the specified speed (2 mm/sec.) or less, BUSY output turns OFF.

vi. If a pulse input signal is not received for 10 ms or longer, OUT0 (INP) output turns ON when the difference becomes smaller than the "positioning width".

---

**Caution**

While the product is being operated in 2-pulse (CW and CCW) mode, do not input the pulse input signals to PP and NP at the same time.

Maintain 10 ms or more interval before inputting reversed pulse signal when changing the actuator moving direction. The minimum interval depends on the operating speed and load.
* It should not be shortened more than necessary.

After changing the IN0 or IN1 signals, wait for 10 ms or more before inputting pulse input signals.

The Card Motor will not perform the positioning operation when the travel distance is shorter than the following values.

Enter pulse input signals greater than the following pulse counts:
LAT3-*: 3 counts, LAT3F-*: 4 counts
(3) Pushing operation

- Procedure –

i. Assign the Step Data No. (IN0, IN1) according to the required pushing force and applied load mass that have been set in the Step Data.

↓

ii. Input pulse signals.*

↓

iii. Turn the "TL" signal ON.

The table starts travelling at a speed of 6 mm/s when the TL signal is turned ON.

↓

iv. The OUT0 (INP) output turns OFF.

↓

v. The BUSY output turns ON.

↓

vi. Pushing is completed when the INF output turns ON

* Input the number of pulses for the target position approximately 1 mm longer than the workpiece position.
(If the number of pulses is too large, returning may take longer.)

- Timing chart-

Caution

Even if the TL signal is turned OFF, pushing operation will continue until the target position of the pulse input and the table position will match, and the table will continue to move to this position if the workpiece is removed. In order to stop the table, input the number of pulses so that the Target Position becomes the required stopping position.

If the table stops while pushing the workpiece, the pushing operation is maintained even though the TL signal is turned OFF. To move on to the next operation, perform Step (4).
(4) Pushing operation completed.

- Procedure -
  
i. Turn TL signal OFF.
  
↓

ii. INF signal turns OFF.
  
↓

iii. Assign the Step Data No. (IN0, IN1) according to the applied load mass that has been set in the Step Data.
  
↓

iv. Enter pulse input signals for the reverse direction to the pushing operation direction. (The controller reads Step Data No. (IN0, IN1).)
  
↓

v. When the target position specified by the pulse input signals and the current position of the Card Motor table becomes the same, the Card Motor terminates the pushing operation and starts the positioning operation.
  
↓

vi. When the Card Motor starts the operation, the BUSY output turns ON.
  
↓

vii. BUSY output turns OFF when the Card Motor speed is reduced to the specified speed of 2 mm/sec or less.
  
↓

viii. If a pulse input signal is not received for 10 ms or longer, the OUT0 (INP) signal turns ON when the deviation becomes the same as "positioning width" or smaller.

(5) Alarm reset

- Procedure -
  
i. An alarm has been generated. (The “ALARM” output is OFF.)
  
↓

(ii) Turn the "SVON" input OFF.
  
↓

(iii) Turn the "SVON" input ON.
  
↓

(iv) The “ALARM” output is turned ON.

\[\text{Caution}\]

Use a 2 msec interval or more between input signals, and maintain the signal state for at least 2 msec. Refer to section 11.4 Response time for the controller input signal (P.52) for details.

14.1 Setup of the controller setting software

(1) Installation of the software
Copy the “LATC_Configurator.exe” execution file to the desktop of your computer. Refer to the installation manual for details.

(2) Start-up
Double-click the LATC_Configurator icon shown below, and the dialog box “Please select COM port No.” will appear.

LATC_Configurator.exe

⚠️ Caution
Please confirm that the controller is connected with the Card Motor and each cable.

(3) Selection of COM port
Select the COM port number the controller is connected to and click [OK].

After one successful connection, the same COM port will be selected automatically at each start up. (The “Please select COM port No.” dialogue box will not appear again). The error shown below will appear on the display if the specified COM port is not found. Check that the controller setting cable has been correctly connected and that the USB driver has been correctly installed.

If the COM port cannot be opened, the error message shown below will appear and the software will start up in offline mode. Only [Step data setup], [Save] and [Open] can be carried out in offline mode.
(4). Assignment of controller ID
The ID is stored in the controller. (Default is 1.)
Click [Start Search] to search the ID of the controller connected to the PC. Select the ID of the controller to be connected after the search operation has been completed and click [Connect].

i. Search range of the controller
Specify the range of IDs to be searched. When the ID of the controller to be connected is already known, specify the numbers, for example from 1 to 1.
* When the range is specified, for example from 1 to 3, the ID of the controllers which are connected to the PC is searched in the range of 1 to 3.

ii. Start Search
ID of the controller connected to the PC is searched, and the result is shown in

iii. ID of the controller to be connected
Specify the ID of the controller to be connected.

iv. Connect
Connects to the controller with the selected ID.

v. Search automatically from the next time.
Once this box is checked, the selected range is automatically searched from the next time after selecting the COM port.

vi. Cancel
When this button is pressed during search, the search is cancelled.
When this button is pressed except when searching, the connection is cancelled and the configuration software will start up with the controller unconnected.

If the controller and the PC cannot be connected due to the reason that COM port can be opened but the controller power supply is OFF, the controller cannot be found and controller ID is not displayed in (4)iii.
In such a case, confirm that power is supplied to the controller and the setting cables are correctly connected to the COM port, for the controller ID to be found and displayed in (4)iii.

⚠️ Caution
Do not connect controllers with the same ID to the PC at the same time.
When the controller ID must be changed, please contact your SMC representative.
(5) Selection of the input type

When the “Select control signal type” dialog box appears, select Pulse Input type.

*If the input type of the controller is already setup, the screen will not be displayed.

When the input type must be changed, initialize the controller and supply power again with reference to section 14.6 Confirmation of the version and Initialization (P.76).

(6) Main window

i. The main window will be displayed. The connected COM port number and controller ID will be displayed in the title bar.

ii. Select a tab according to the application situation.

⚠️ Caution

Do not turn off the power supply to the controller and do not connect or disconnect the controller setting cable whilst the Controller Setting Software is running.

Turn off the power supply to the controller when disconnecting the controller setting cable.

If the power supply to the controller is turned off whilst the Controller Setting Software is running, turn on the power supply immediately to recover.

If the cable is disconnected, restart the Controller Setting Software after reconnecting the cable.
14.2 Basic Parameter Setup window

Register the basic parameter set up of the actuator (Card Motor).
If the controller is connected normally, the data registered in the controller will be displayed in the “Basic Parameter Set up” window immediately after the software starts up.

If the [Setup] button is selected after any of the parameters have been changed, the setting values are saved to the controller connected to the PC.

i. Card Motor Product Number
   Select the product number of the Card Motor connected to the controller.

ii. Card Motor Mounting Orientation
    Select horizontal or vertical Card Motor orientation.

iii. Return to Origin Method
     Select the required method of returning to origin position. (Sensor origin can only be selected for the LAT3F-**)

iv. Pulse Input Control Mode
    Select the pulse input control method.
    (Refer to the section 9.3 Basic Parameter Setup (P.41) for details.)
    Pulse and Direction: The actuator can be operated by inputting 1 pulse signal and 1 direction signal.
    CW and CCW: The actuator can be operated by inputting 2 pulse signals.
    The operation direction is determined based on which pulse input receives the pulse signals.
Quadrature: The operation direction is specified by the order of 2 pulse input signals.
- Extended direction --> PP+/PP- leads NP+/NP- 90 degree.
- Retracted direction --> PP+/PP- lags NP+/NP- 90 degree.

v. Comm (Communication)
If the communication is disconnected whilst the Controller Setting Software is running, the communication can be restored by clicking the “Communication” button. However, communication cannot be restored unless the cause of the communication disconnection is solved.

vi. Setup
The set Basic Parameters are sent to the controller connected to the PC.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>To finalize the settings, execute the controller reset operation as shown below before operating the Card Motor.</td>
</tr>
</tbody>
</table>

![Controller reset confirmation message]

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the communication is discontinued during the transmission of the Basic Parameters, the data may not be stored correctly. If this happens, it may appear that the data has been stored correctly, when the software is restarted and the set data is read from the controller to the software, but the data has actually not been stored to the controller. Supply power to the controller again and set and send the data to the controller again.</td>
</tr>
</tbody>
</table>
14.3 I/O Setup window

Parallel I/O signals can be checked and output signal functions can be configured.

[i/O Setup window]

i. Input/Output
Displays the current input and output signals status.
Confirm that input signals turn on and off according to the signals output from the device connected to the parallel I/O connector. The PLS indicator changes to green when a pulse signal is input to the controller.

ii. Manual Output
Each output signal can be turned ON and OFF manually regardless of their current status, to check and verify the connections between the controller and a master control device such as a PLC.
Normally the ALARM output is OFF when an alarm has been generated, but the ALARM output can be turned ON manually by pressing the ALARM button.
Manual outputs are cancelled when another window is selected.
Confirm that the input signals of the device connected to the parallel I/O connector turn on and off according to the output signals.
iii. AREA range

The position ranges for the AREA output signals can be configured. Individual position ranges can be set for up to two outputs: “AREA A” and “AREA B”. The resolution for the “Position 1” and “Position 2” settings varies depending on the Card Motor models.

<table>
<thead>
<tr>
<th>Card Motor type</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAT3-</td>
<td>0.03 mm</td>
</tr>
<tr>
<td>LAT3F-</td>
<td>0.005 mm</td>
</tr>
</tbody>
</table>

The position ranges should be set as follows: Position 1 ≤ Position 2.

The current table position of the Card Motor can be read by pressing the [P] button after the return to origin has been completed.

* If the Card Motor Product Number is changed and downloaded to the controller in the Basic Parameter Setup window then the current Area Range settings will be cancelled.

When a different Card Motor product number is entered, the Area Range values must be set again.

iv. Threshold Force Value

This determines the condition for when the INF signal is activated. The INF signal turns ON when the pushing force generated by the Card Motor exceeds the set value. The “Threshold Force Value” and the “Thrust Setting Value” in the Step Data are independent of each other. The INF output will not be activated if the “Threshold Force Value” is greater than the “Thrust Setting Value” in the Step Data, because the “Threshold Force” will never be reached.

v. Configuration of Output Signals

The function of the parallel I/O output signals OUT0 and OUT1 can be selected. Another signal function can also be assigned to the BUSY output terminal. It is possible to use the same function for more than one output terminal.

Refer to 7.4 Parallel I/O Signals (Pulse Input Type) (P.29) for details of the output signals.

vi. Comm (Communication)

If the communication is interrupted whilst the Controller Configuration Software is running, the communication can be restored by clicking the “Comm” button.

However, the communication may not be completely restored unless the cause of the communication disconnection is solved.

vii. Setup

Changed values are sent to the controller connected to the PC. However, the Manual Output status will not be saved.
14.4 Step Data Setup window

The actuator (Card Motor) operation can be registered with up to 4 operations (steps). When [Upload] is executed, the applicable data registered in the controller is displayed in the List view.

If [Download] is executed after the settings have been changed, the setting values are sent to the controller connected to the PC.

When an item in the List view is selected, the content can be edited in the input form (i). Other step data lines can be selected and edited using one of the following methods:

a) Select the step data line in the List view.

b) Press the Enter key to skip to the next data line in List view or Input form.

c) Press the up or down arrow keys (↑↓) in List view or Input form.

Store the content of the changed step data to the controller by selecting the download button in the Command buttons area (ii). Data in the Input form can be cancelled by pressing the Esc key.
a) Thrust Setting Value (Thrust)
Set the maximum force for the pushing operation. The setting range is 1 to 5, 1 to 4.8 or 1 to 3.9 depending on the stroke of the Card Motor.
The Thrust Setting Value can be selected when [Pushing] has been selected in [Operation] in the “Basic Parameter Set up” window.
The Thrust Setting Value can be set in increments of 0.1.
* The Thrust Setting Value should be less than the allowable thrust setting force of the Card Motor used.
Refer to the LAT3 series (Card Motor) operation manual for the allowable thrust force setting values.

b) Load Mass (Mass)
Set the load mass of the work piece mounted on the Card Motor. The setting ranges from 0 to 500 g in increments of 50 g.
* The selected load mass is a nominal value, therefore check the operation sufficiently before setting and using the Card Motor and controller.
* The controller uses the load mass value set for “Step Data No.1” for the Return to Origin operation, and for Jogging and Inching. Confirm that the load mass set for “Step Data No.1” corresponds to the Return to Origin and/or Jogging and Inching operations.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
</table>
Set the "load mass" value for the Step Data as close as possible to the load mass mounted onto the table. Avoid changing the load mass whilst the table is moving.
The table may vibrate if there is a large difference between the "load mass" set in the Step Data and the load mass mounted on the table.

ii. Command buttons

🔍 Cut
Cut the selected step data.
* It is possible to cut the step data in the list view by right-clicking and selecting [Cut] from the pop-up menu.

 chóng Copy
Copy the selected step data.
* It is possible to copy the step data in the list view by right-clicking and selecting [Copy] from the pop-up menu.

_singular Paste
The copied or cut data can be pasted to the selected step data.
* It is possible to paste the step data in the list view by right-clicking and selecting [Paste] from the pop-up menu.
Save
Save the step data as a text file to the PC.

Open
Read the Step Data from the stored text file and display it in the List view (i).

Upload
Upload the data stored in the controller to the Setting software (PC), and display it in the Setting software window (Controller -> PC).

Download
Download the data in the setting software to the controller (PC -> controller).

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the process is interrupted whilst uploading data from the controller, the data may not appear correctly in the Controller Setting Software.</td>
</tr>
<tr>
<td>In this case, upload the data again.</td>
</tr>
<tr>
<td>If the process is interrupted whilst downloading data from the Controller Setting Software, the data may not be stored correctly to the controller.</td>
</tr>
<tr>
<td>If this happens, it will appear as if the data has been stored correctly when the software is restarted and the set data is read from the controller, but the data has actually not been stored to the controller.</td>
</tr>
<tr>
<td>Disconnect and Supply the power to the controller and set and store the data again.</td>
</tr>
</tbody>
</table>

iii. Pop-up menu

When right-clicking the List view, the pop-up menu will be displayed.
14.5 Monitor/Test window

This screen is used to monitor the input and output status of the controller when it is connected to the PLC and to perform operation tests of the Card Motor by using the set step data.

i. Status display
Current parallel I/O status, current step data No., position, speed and pushing force are displayed on the computer (after the Return to Origin operation has been performed). All values shown in this display are reference values only.

ii. Alarm window
The latest alarm status or alarm history can be checked. The background is usually gray, but in case of error, it is changed to red, showing the current alarm status. When the background is gray, the error history is displayed until the alarm history is cleared.
The alarm history can be cleared by pressing the [Alarm reset] button below it.
*The alarm history is not reset by turning off the power. Please reset the history after releasing the alarm once after generating the alarm. (Refer to section 16. Alarm Detection (P.80)).

iii. Test mode/Monitor mode
By switching to Monitor Mode the Card Motor can be operated with external I/O signals, and the operating status can be monitored. (In Monitor Mode, it is not possible to control the operation using the controller configuration software).
Once the mode is changed to Monitor Mode, perform Return to Origin position by PLC before use.
Note that every control function is cancelled when switching between Monitor Mode and Test Mode.
iv. Servo
When this button is clicked, a command to energize the Card Motor is sent to the controller. When this button is clicked again, a command to de-energize the Card Motor is sent to the controller.

v. Return to Origin
When this button is clicked, a return to origin command is immediately sent to the controller. After the return origin operation has been completed, this button is cancelled automatically. Select the method for the Return to Origin operation from the [Return to Origin Method] menu in the "Basic Parameter Setup" window.

vi. Jog
Whilst this button is being pressed, the Card Motor table moves at the speed set in the "Speed" list box, or with the slide button. When this button is released, the Card Motor table stops operating. The right button is for the + direction (towards the extended end), and the left button is for the - direction (towards the retracted end).

vii. inching
By clicking this button the Card Motor table moves the distance set in the "Move Distance" list box. (The "Speed" is the same as is set for Jogging.) The table moves in the + direction (towards the extended end) when the + button is clicked, and in the - direction (towards the retracted end) when the - button is clicked.

![Caution]
Set the “Travel Distance” so that the Target Position will be within the stroke range. If the “Travel Distance” is set outside the target position, the Card Motor will stop at the stroke end.

**When an alarm is generated**
If the [ALM] LED on the front of the controller is red or flashing, an alarm has been generated. Perform SVON reset to cancel the alarm after measures and revisions have been made.

**SVON reset**
Click [Servo On] first and then click [Servo Off].

Note) The type of alarm can be checked by a combination of the ALM and PWR LED’s on or flashing. Refer to section 16. Alarm Detection (P.80) for detailed content of the alarms.
14.6 Confirmation of the version and initialization

The version of the configuration software can be checked by clicking the icon in the upper left corner of the title bar, and then selecting “About(A)...”. The version information window will be displayed. The controller version will be displayed by clicking the “Details” button.

When the [Initialize] button is clicked, the controller will be initialized to default settings.

14.7 Closing the software

The software can be closed by clicking the [Close] button on the top right of the window or from the title menu (by clicking the icon on the top left and then selecting “Close”).

⚠️ Caution

Turn the power supply to the controller OFF and ON again before operating the controller with the parallel I/O signals after the Controller Setting Software has been terminated.

Refer to section 13.1 Overview of the operation instructions (P.60) regarding parallel I/O operation.

15.2 Controller setting kit

(1) How to Order the Controller setting kit

Controller setting kit

(2) Contents of the kit

(i) Controller setting software (CD-ROM) LATC-W2-S
(ii) Controller setting cable (Communication cable and USB cable)

- Communication cable: LEC-W2-C
- USB cable: LEC-W2-U

(3) Operating environment

PC with Windows® 7 32bit or 64bit and USB1.1 or USB2.0 port.

Windows® 7 is a registered trademark of the United States Microsoft Corporation.

* An operation test of this controller and configuration software can be performed by using only the controller and the configuration software with the following minimum requirements: [CPU speed 2.53 GHz, 2 GB RAM, Windows 7 Professional operating system]. Note that depending on the specifications of the used PC and the operating conditions, the Card Motor may not operate in accordance with the set time, even if the test operation time is set to minimum.

### Caution

Compatibility of controller setting cables applicable to this controller.

✗:Not OK
15.3 Multi-counter CEU5

Please refer to the operation manual for the CEU5 series Multi-counter for further details.

(1) How to Order the Multi-counter

C E U 5 □ □ — □

- Power supply voltage
  - NIL: 100 VAC to 240 VAC
  - D: 24 VDC

- External output
  - NIL: RS-232C
  - B: RS-232C + BCD

- Output transistor type
  - NIL: NPN open collector output
  - P: PNP open collector output

(2) Wiring

Connect wires according to the instructions in section “6. CN4: Counter plug” (P.24).

(3) How to operate

When executing Step data No. 0 (Return to Origin Position), the RESET signal is output from the controller after the [Return to Origin Position] operation has been completed. With this operation, the CEU5 is reset and the position is set to zero, both in the controller and Multi-counter.

When [Sensor Origin] is selected as the [Return to Origin Method] in the “Basic Parameter Set up” window, the sensor origin position is set to zero. When [Extended End Position] is set as the origin position, the position after full-stroke is set to zero. Therefore, an offset in the counter position adjustment function must be added as required. When the origin position is set to [Retracted End Position] or [Extended End Position], the origin position will be set to approximately 0.3 mm away from the table end.

If the position where the table comes into contact with the external workpiece needs to be displayed as zero on the counter, reset the counter separately using the PLC etc. with the table pushed up against the workpiece.

**Caution**

CEU5 Multi-counter parameter settings:
Switch the CEU5 Multi-counter to Function mode [FUNC.] and set the Pre-scale [PRESCL] parameters to match the connected Card Motor model according to the specifications in the table below.

<table>
<thead>
<tr>
<th>Encoder resolution (μm)</th>
<th>LAT3-□</th>
<th>LAT3F-□</th>
<th>LAT3-□</th>

  - MANUAL

- Multiplier factor
  - X4

- Value per 1 pulse
  - 0.00300

- Decimal point position
  - **.****

- Input type
  - 2PHASE

Note 1) Since the CEU5 Multi-counter has a 6-digit display, the tens of digits will not be displayed when the resolution is set to 1.25.

The Multi-counter may lose pulses when a long counter cable is used or when the Card Motor travels at high speed.

Refer to the CEU5 Multi-counter operation manual for setting details.
16. Alarm Detection

It is possible to check the type of an alarm by a combination of the ALM and PWR LED’s on or flashing. When an alarm is generated, de-activate the alarm after troubleshooting and correct the error with reference to section 16.2 Alarms and countermeasures (P.81).

Alarms are divided into two types. One alarm type can be cleared by resetting the SVON input signal (ON-OFF-ON). The other type cannot be cleared unless the power supply to the controller is turned off.

16.1 Alarm LED display

The controller uses an LED display to indicate the type of alarm when an alarm is generated.

<table>

### 16.2 Alarms and countermeasures

<table>
<thead>
<tr>
<th>Alarm name</th>
<th>Recovery method</th>
<th>Content / Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory error</td>
<td>Turn the power off and on again.</td>
<td>&lt;Content of error&gt; Internal memory failure. Check if the conditions described below have occurred. (1) Power supply disconnected during data storing. (2) Disconnection of the power supply voltage. (3) Noise due to crossing of cables and power lines. <strong>&lt;Countermeasure&gt;</strong> Turn off the power and then turn it on again.</td>
</tr>
<tr>
<td>Actuator cable disconnected</td>
<td>Turn the power off and on again or reset using the SVON input.</td>
<td>&lt;Content&gt; When operation signal is input to the controller with Card Motor unconnected to the controller, this error occurs. <strong>&lt;Countermeasure&gt;</strong> Check the connection of the Card Motor and actuator cable. Connect the Card Motor to the controller via an actuator cable, and start the operation again after turning on power or turning off the SVON signal.</td>
</tr>
<tr>
<td>Temperature error</td>
<td>Turn the power off and on again or reset using the SVON input.</td>
<td>&lt;Content of error&gt; The rated temperature has been exceeded due to increase in the temperature of the motor. Check if the conditions described below have occurred. (1) The product is used in a location where the specified ambient temperature is exceeded. (2) There is a heat generating source near the Card motor. (3) The product is used with a force exceeding the allowable thrust setting value. <strong>&lt;Countermeasure&gt;</strong> Review the ambient temperature and check the operation after supplying power again or after turning the SVON input signal OFF temporarily.</td>
</tr>
<tr>
<td>Over current error (Motor overload error) (Over current error)</td>
<td>Turn the power off and on again or reset using the SVON input.</td>
<td>&lt;Content of error&gt; This alarm is generated when the Card Motor has been overloaded causing an overcurrent to flow through the Card Motor, or when overcurrent flows through the parallel output terminals. Check if the conditions described below have occurred. (1) Motor overload error - The Card Motor cannot reach the target position during positioning due to obstacles. (2) Over current error - The connection of the output signal is not correct. <strong>&lt;Countermeasure&gt;</strong> Check the Card Motor type and rated value. Turn the power off and on again. Check the operation again after turning the SVON input signal OFF.</td>
</tr>
<tr>
<td>Pulse input error (Pulse frequency error) (Pulse overflow error)</td>
<td>Turn the power off and on again or reset using the SVON input.</td>
<td>&lt;Content of error&gt; This error occurs when the input of the pulse input signals is incorrect. Confirm whether any of the conditions described below have occurred. (1) Pulse frequency error This error occurs when the pulse signal frequency exceeds the specified value. (2) Pulse overflow error This error occurs when the pulse counter in the controller overflows. <strong>&lt;Countermeasure&gt;</strong> Check the pulse signal. Turn off and on the power supply or the SVON input signal and use within the specifications.</td>
</tr>
<tr>
<td>Parameter error</td>
<td>&lt;Content of error&gt; The basic parameter setup and step data settings are not correct. Check if any of the conditions described below have occurred.</td>

</tbody>
</table>
17. Controller and Peripheral Devices Specific Precautions

17.1 Design and selection

⚠️ Warning
1. The specified voltage must be used.
   Otherwise, malfunction and damage to the controller may result.
   If the applied voltage is lower than the specified voltage, it is possible that the load cannot be moved due to an internal voltage drop. Check the operating voltage before use. If the current supplied is too low, it may not be able to achieve the maximum force or may cause a malfunction.

2. Do not operate beyond the specifications.
   Fire, malfunction, or damage to the product can result. Check the specifications before use.

3. Install an emergency stop circuit.
   Install an emergency stop outside of the enclosure so that the system operation can be stopped immediately and the power supply disconnected.

4. In order to prevent danger and damage due to the breakdown and the malfunction of this product, which may occur at a certain probability, a backup system should be established in advance by providing a multiple-layered structure or a fail-safe design to the equipment, etc.

5. If a fire or personal injury is expected due to abnormal heat generation, ignition, smoke from the product, etc, disconnect the power supply to the product and the system immediately.

⚠️ Caution
1. SMC products are not intended for use as instruments for legal metrology.
   Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country. Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.

17.2 Handling Precautions

⚠️ Warning
1. Never touch the inside of the controller/driver.
   It may cause an electric shock or damage to the controller.

2. Do not perform operation or setting of this equipment with wet hands.
   It may cause an electric shock.

3. A product that is damaged or missing any components should not be used.
   Electric shock, fire, and injury can result.

4. Do not connect the controller to actuators other than the Card Motor.
   It may cause damage to the controller or the actuator.

5. Be careful not to be caught or hit by the workpiece while the actuator is moving.
   It may cause an injury.

6. Do not connect the power supply or power to the product until it is confirmed that the area where the workpiece moves is safe.
   The movement of the workpiece may cause an accident.
7. Do not touch the product when it is energized and for some time after power has been disconnected, as it is very hot. It may cause burns due to the high temperature.

8. Check the voltage using a tester at least 5 minutes after power-off when performing installation, wiring and maintenance. Electric shock, fire, and injury can result.

9. Incorrect wiring can cause malfunction or damage the product. Do not touch the controller while power is supplied to it. Take safety measures against static electricity when it is necessary to touch the controller during maintenance.

⚠️ Caution
1. When the multi-counter is not used, mount the counter plug (supplied) to the counter connector. If foreign matter such as metal fragments enters the counter connector, short-circuit may occur.

2. Be sure to perform a return to origin position operation before operating the actuator. If the origin position is not set, the product will not operate even if a step data command has been selected.

3. The positioning time set and entered in the Controller setting software is a nominal target value for operation. The positioning time is not guaranteed. The operation may not have been completed even if the set positioning time has passed. In such a case, detect that the operation has been completed by monitoring the BUSY and INP signals.

4. Set the approximate weight of jigs or workpieces mounted on the Card Motor as the Load Mass in the controller setting software. If the value selected in the controller setting software and the weight of the workpieces are different, the product may vibrate or the positioning accuracy may decrease.

5. When the load mounted on the Card Motor is small (for example 100 g or less) and the Card Motor has stopped at a target position, the Card Motor may continuously hunt for the target position (vibrate) within the positioning accuracy range, depending on the operating conditions. Please contact an SMC sales representative for how to improve it.

6. BUSY output signal
   The BUSY output signal turns ON when the Card Motor begins to operate, and it turns OFF when the operating speed reaches 2 mm/s or less. However, when the Card Motor operates at a slower speed than 5 mm/s, the BUSY signal may not turn ON at all.

7. INP output signal
   Both in positioning operation and pushing operation, if the specified INP positioning range of the set Target Position is reached, the INP signal will turn ON. In pushing operation, if the table passes the INP range of the Target Position and stays outside the specified INP positioning range, the signal will turn OFF again.

<table>
<thead>
<tr>
<th>INP signal output range</th>
</tr>
</thead>

</tr>
<tr>
<td>LAT3F-*</td>
</tr>
<tr>
<td>LAT3-*</td>
</tr>
</tbody>
</table>
17.3 Installation

⚠️ Warning
1. The controller and its peripheral devices should be installed on a fire-proof material.
   Direct installation on or near a flammable material may cause fire.

2. Do not install this product in a place subject to vibration and impact.
   A failure and malfunction can result.

3. Do not mount this controller and its peripheral devices near to a large electromagnetic contactor
   or no-fuse breaker which generates vibration on the same panel. Mount them on different panels,
   or keep the controller and its peripheral devices away from such a vibration source.
   A failure and malfunction can result.

4. This controller and its peripheral devices should be installed on a flat surface.
   If the mounting surface is distorted or not flat, excessive force may be applied to the housing, etc.
   causing malfunction.

17.4 Power supply

⚠️ Warning
1. Use a power supply with low noise between lines and between power and ground.
   In cases where noise is high, use an isolation transformer.

2. The power supplies should be separated between the controller power and the I/O signal power
   and both Power supplies must not be of the “in-rush current limiting type”.
   If the power supply is of the “in-rush current limiting type”, a voltage drop may occur during the
   acceleration of the actuator.

3. Take appropriate measures to prevent surges from lightning. Ground the surge absorber for
   lightning separately from the grounding of the controller and its peripheral devices.

4. Use the UL-certified products listed below for the direct current (DC) power supply.
   a) Limited voltage current circuit in accordance with UL 508.
      A circuit to which power is supplied by a secondary coil of a insulated transformer that meets the
      following conditions
         - Maximum voltage (No load): 30 Vrms (42.4 V peak) or less
         - Maximum current: 8 A or less (including short circuit)
      Limited by circuit protector (such as fuse) with the following ratings
      
      | Voltage without load (V peak) | Maximum current rating (A) |
      |-------------------------------|---------------------------|
      | 0 to 20 [V]                   | 5.0                       |
      | Over 20 [V] up to 30 [V]      | 100                       |
      |                               | Peak voltage              |

   b) Circuit (class 2) with maximum 30 Vrms (42.4 V peak) or less, which uses a class 2 power supply unit
      in accordance with UL1310 or class 2 transformer in accordance with UL 1585 as the power supply

17.5 Grounding

⚠️ Warning
1. Make sure the product is connected to ground to ensure the noise resistance of the controller.
   Otherwise it may cause malfunction, damage, an electric shock or fire.
   Do not share the ground connection with equipment that generates a strong electromagnetic noise.
2. A dedicated Ground connection must be used.
   Grounding should be to a D-class ground connection. (Ground resistance 100 Ω or less)

3. The Ground connection should be as close as possible to the controller, and the ground wire kept as short as possible.

4. In the unlikely event that malfunction is caused by the ground connection, it may be disconnected.

17.6 Wiring

⚠️ Warning

1. Preparation for wiring
   Switch the power supply off before wiring or plugging and unplugging of connectors.
   Mount a protective cover over the terminals after the wires have been connected.

2. Do not route the digital I/O signal wires and power supply cables together.
   Malfunction due to noise may occur if the digital I/O signal and power cables are routed together.

3. Confirm proper wiring before turning the power on.
   Incorrect wiring will lead to malfunction or may damage the controller or its peripheral devices depending on the seriousness of the wiring error.
   Confirm that there is no mis-wiring before turning the power on.

4. Reserve enough space for the routing of the cables.
   If the cables are forced into unreasonable positions, it may damage the cables and connectors, which may lead to misconnection or short-circuit and result in malfunction.
   Avoid bending the cables in sharp angles close to the connectors or where they enter the product.
   Fix the cable as close as possible to the connectors so that mechanical stress is avoided.

17.7 Operating environment

⚠️ Caution

1. Do not use the product in an area where it could be exposed to dust, metallic powder, machining chips, or splashes of water, oil or chemicals.
   A failure or malfunction can result.

2. Do not use the product in an area where a magnetic field is generated.
   It will cause failure or malfunction.

3. Do not install the product in an environment where flammable gas, explosive or corrosive gas, liquids or other substances are present.
   It could lead to fire, explosion and corrosion.

4. Avoid radiant heat from large heat sources such as direct sunlight or hot furnaces.
   It will cause failure of the controller or its peripheral devices.

5. Do not use the product in an environment subjected to cyclic temperature changes.
   It will cause failure of the controller or its peripheral devices.
6. Do not use in a place where surges are generated.
   When there are units that generate a large amount of surge around the product (for example solenoid type lifters, high frequency induction furnaces, motors, etc.), this may cause deterioration or damage to the product's internal circuit. Avoid surge generation and crossed lines.

7. Neither the Card Motor nor the controllers have the tolerance to the thunder surge.

8. Do not install this product in an environment subjected to vibration and impact.
   It will cause failure or malfunction.

9. If this product is used in conjunction with a relay or solenoid valve, use a type with a surge absorbing element built-in.

10. Do not expose the product to a strong light source such as direct sunlight.
    The Card Motor uses an optical sensor to detect the position, so if it is exposed to a strong light source such as direct sunlight, a malfunction could occur. In such a case, install a light shielding plate.

17.8 Maintenance

⚠️ Warning
1. Perform maintenance checks periodically.
   Confirm that wiring and screws are not loose.
   Loose screws or wires may cause unexpected malfunction.

2. Conduct an appropriate functional inspection and test after completing maintenance.
   In case of any abnormalities (if the actuator does not move, etc.), stop the operation of the system.
   Otherwise, an unexpected malfunction may occur and it will become impossible to ensure safety. Conduct an emergency stop test instruction to confirm safety of the equipment.

3. Do not disassemble, modify or repair this controller or the peripheral devices.

4. Do not put anything conductive or flammable inside of this controller.
   Burning or explosion can result.

5. Do not perform an insulation resistance test or insulation withstand voltage test.

⚠️ Caution
1. Ensure sufficient space for maintenance.
   Design the system that allows the required space for maintenance.
18. Troubleshooting
Refer to the table below for troubleshooting.
When none of the causes in the troubleshooting can be confirmed, it is presumed that the product is faulty and normal operation can only be recovered by the replacement of a part.
There is a possibility that this product has been damaged due to the operating conditions (problems relating to the application), so please contact SMC to discuss appropriate measures.

18.1 Operation errors
